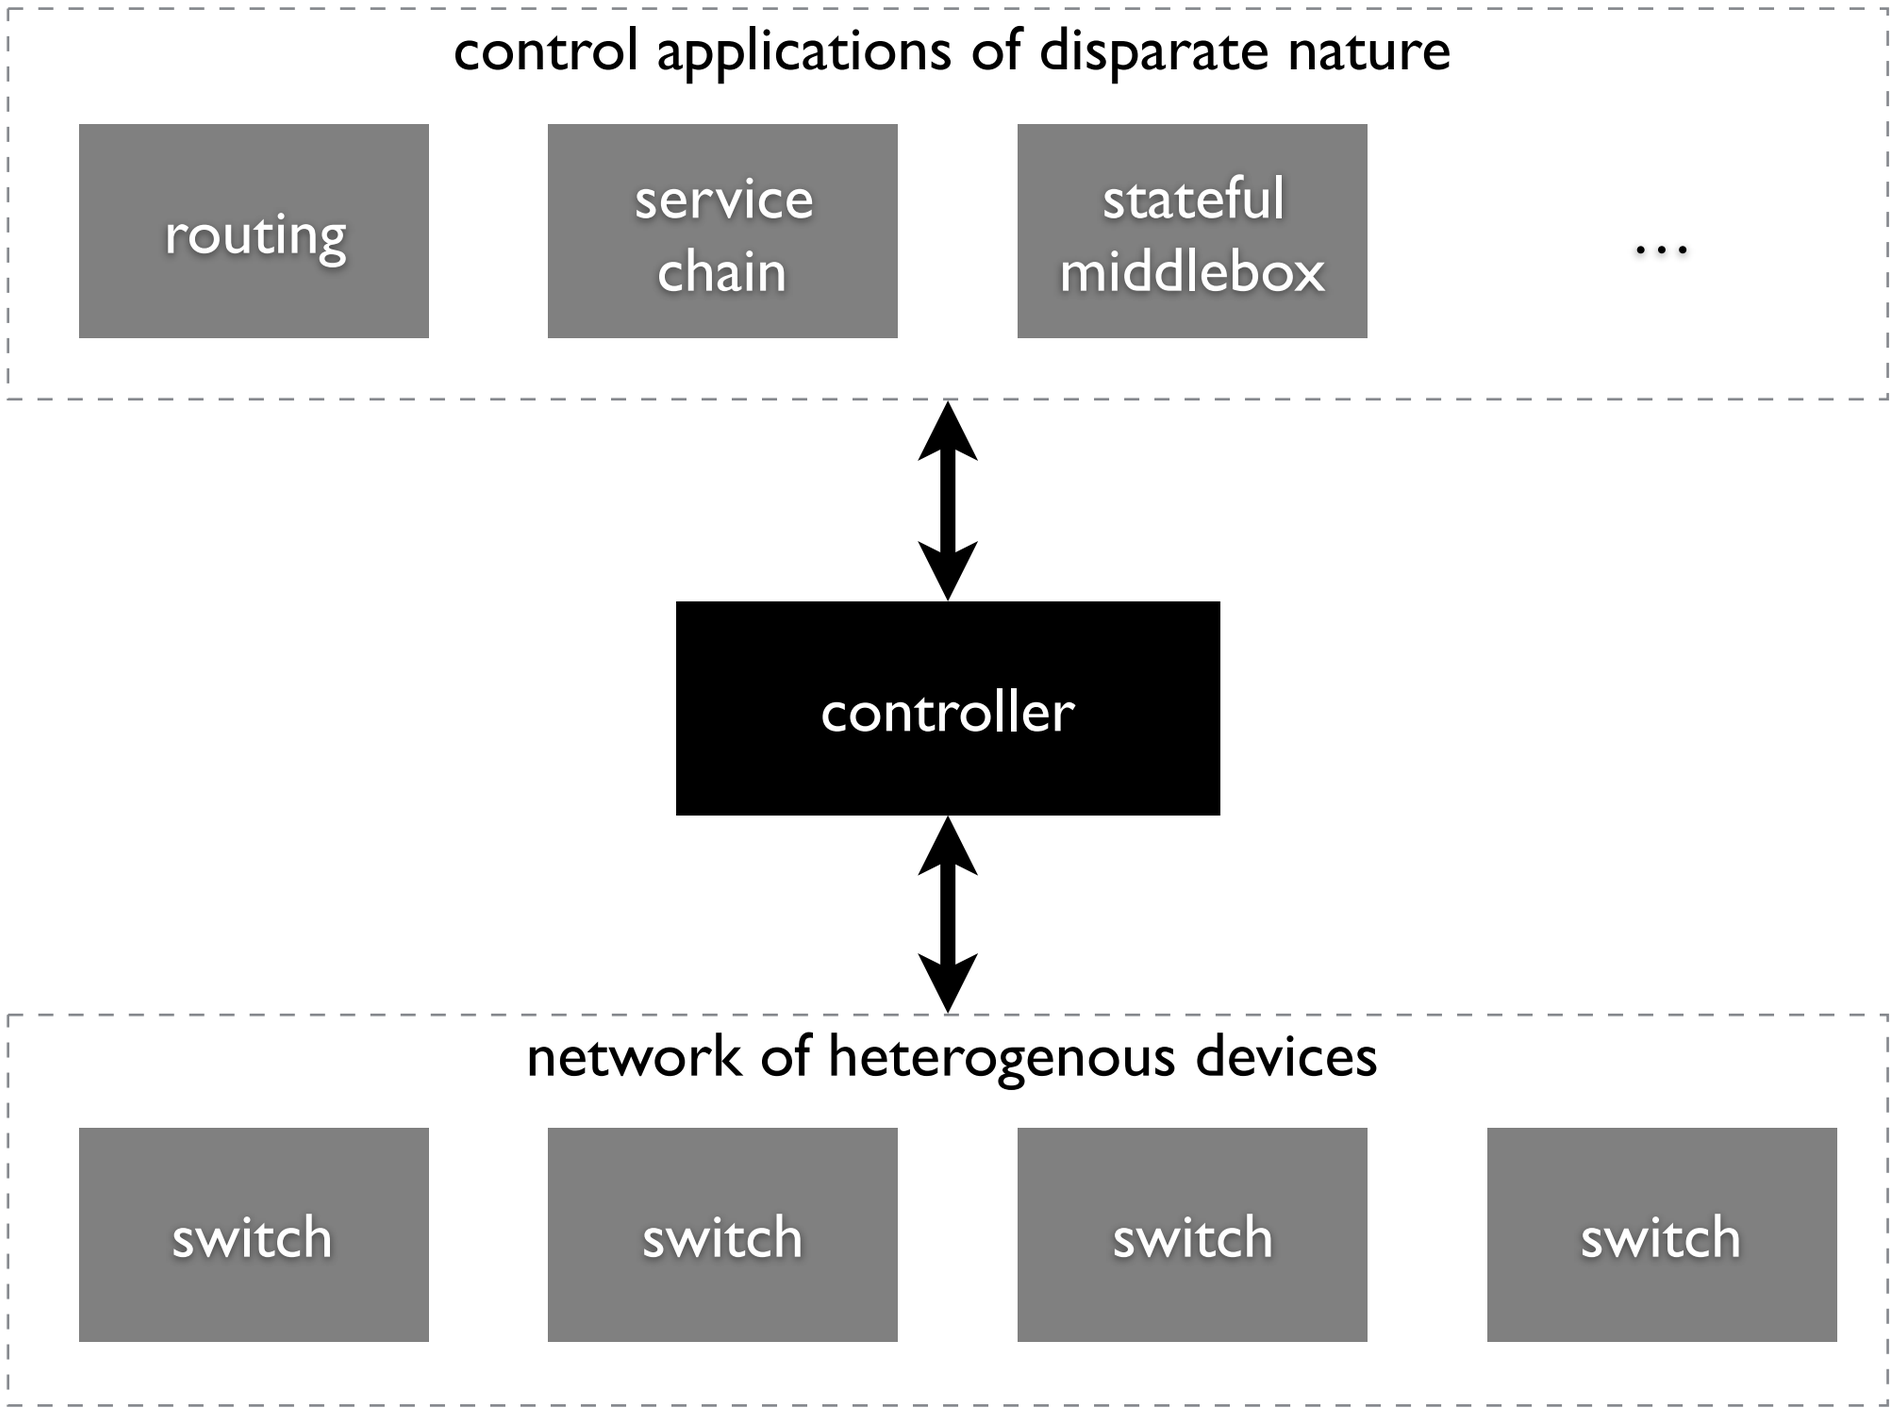
Ravel: a database-defined network

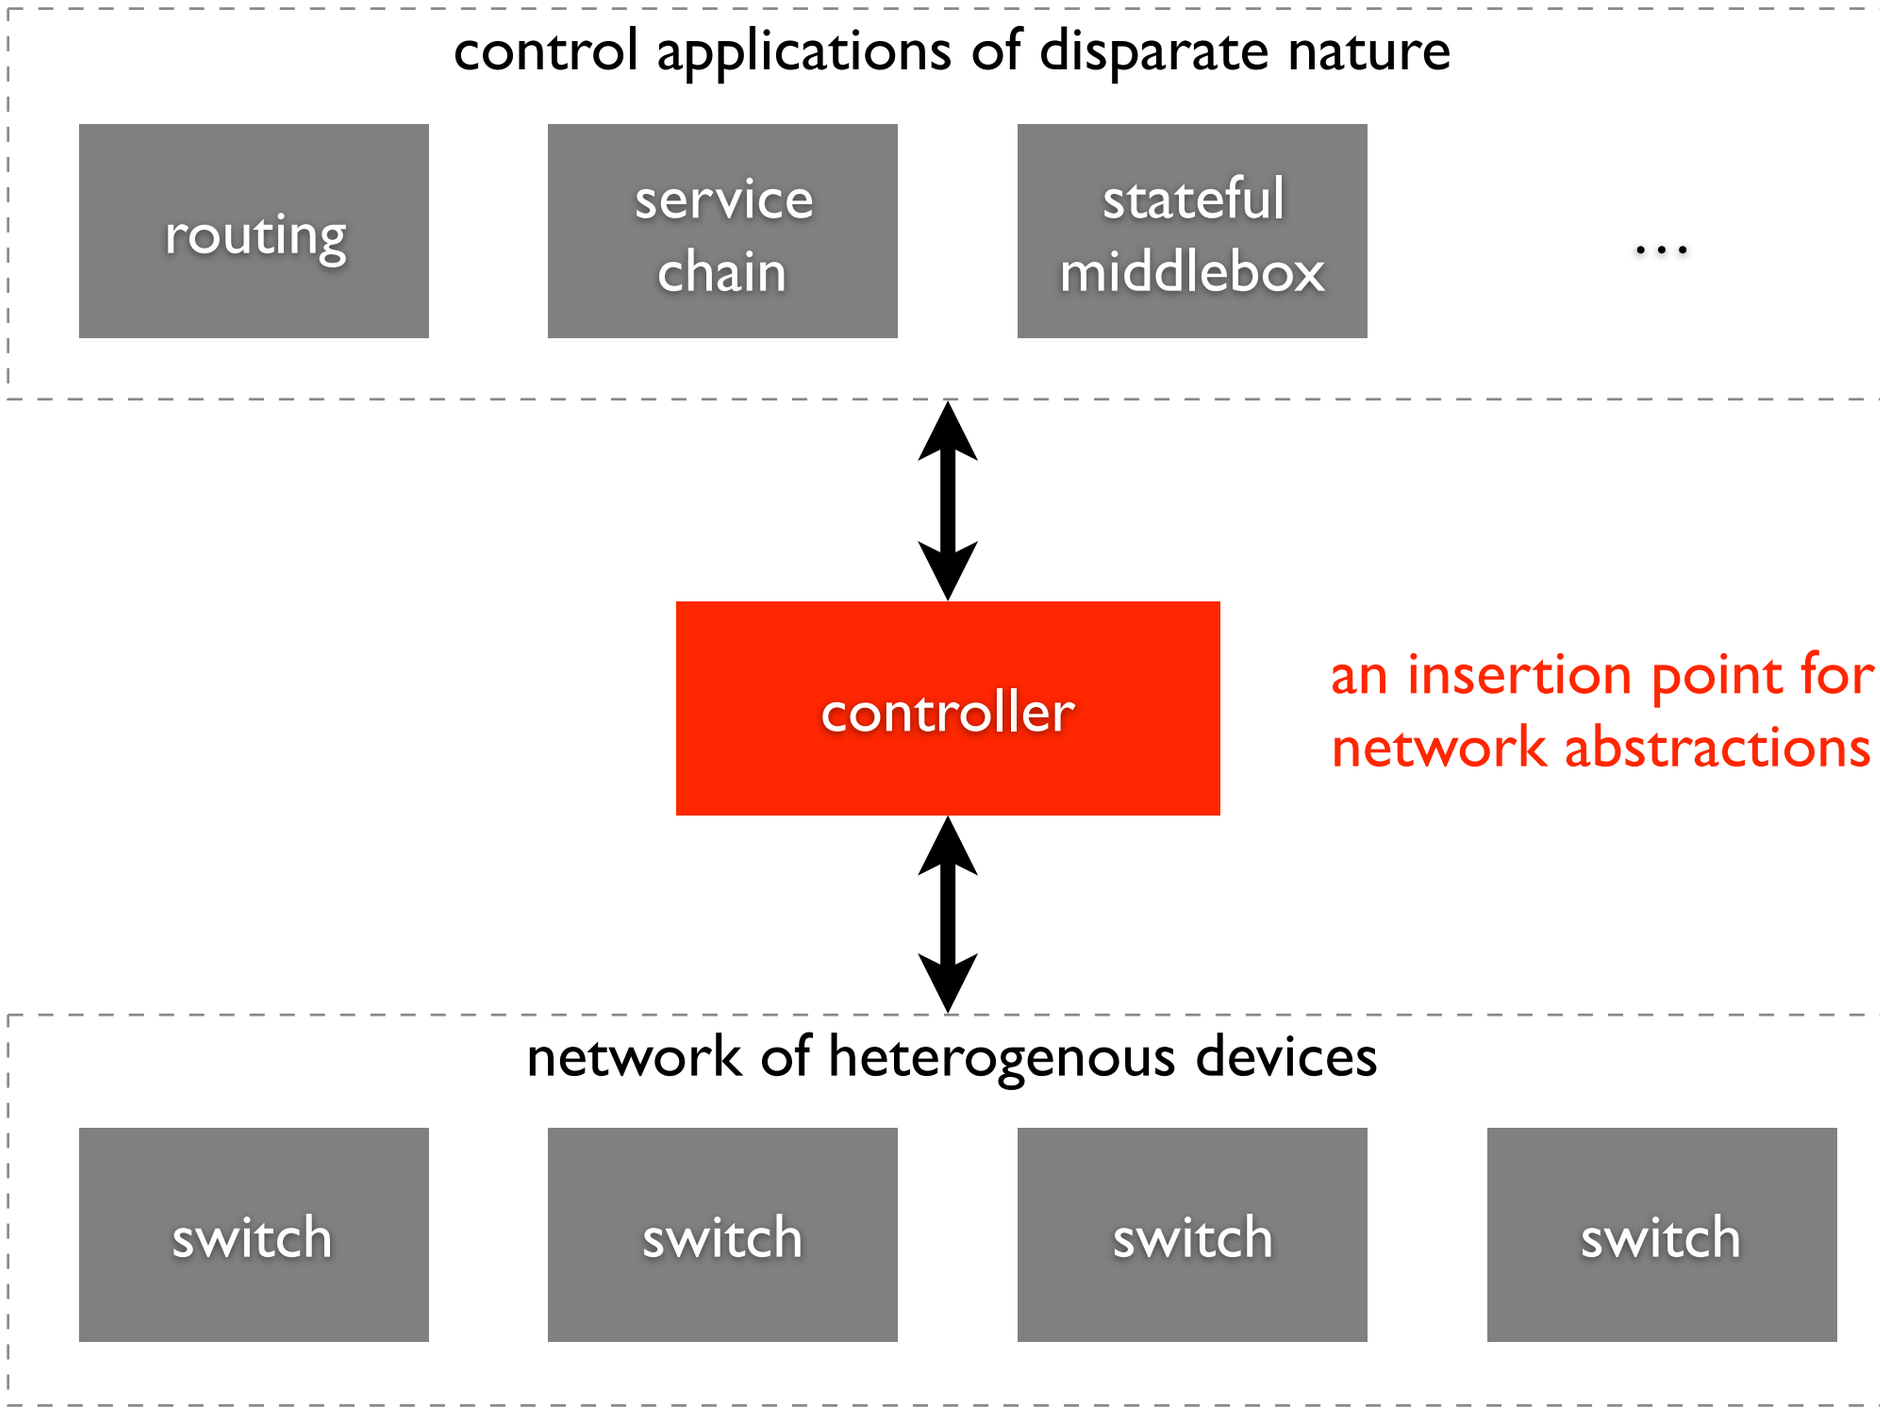
Anduo Wang Xueyuan Mei Jason Croft
Matthew Caesar Brighten Godfrey

March 14, 2016 SOSR'16

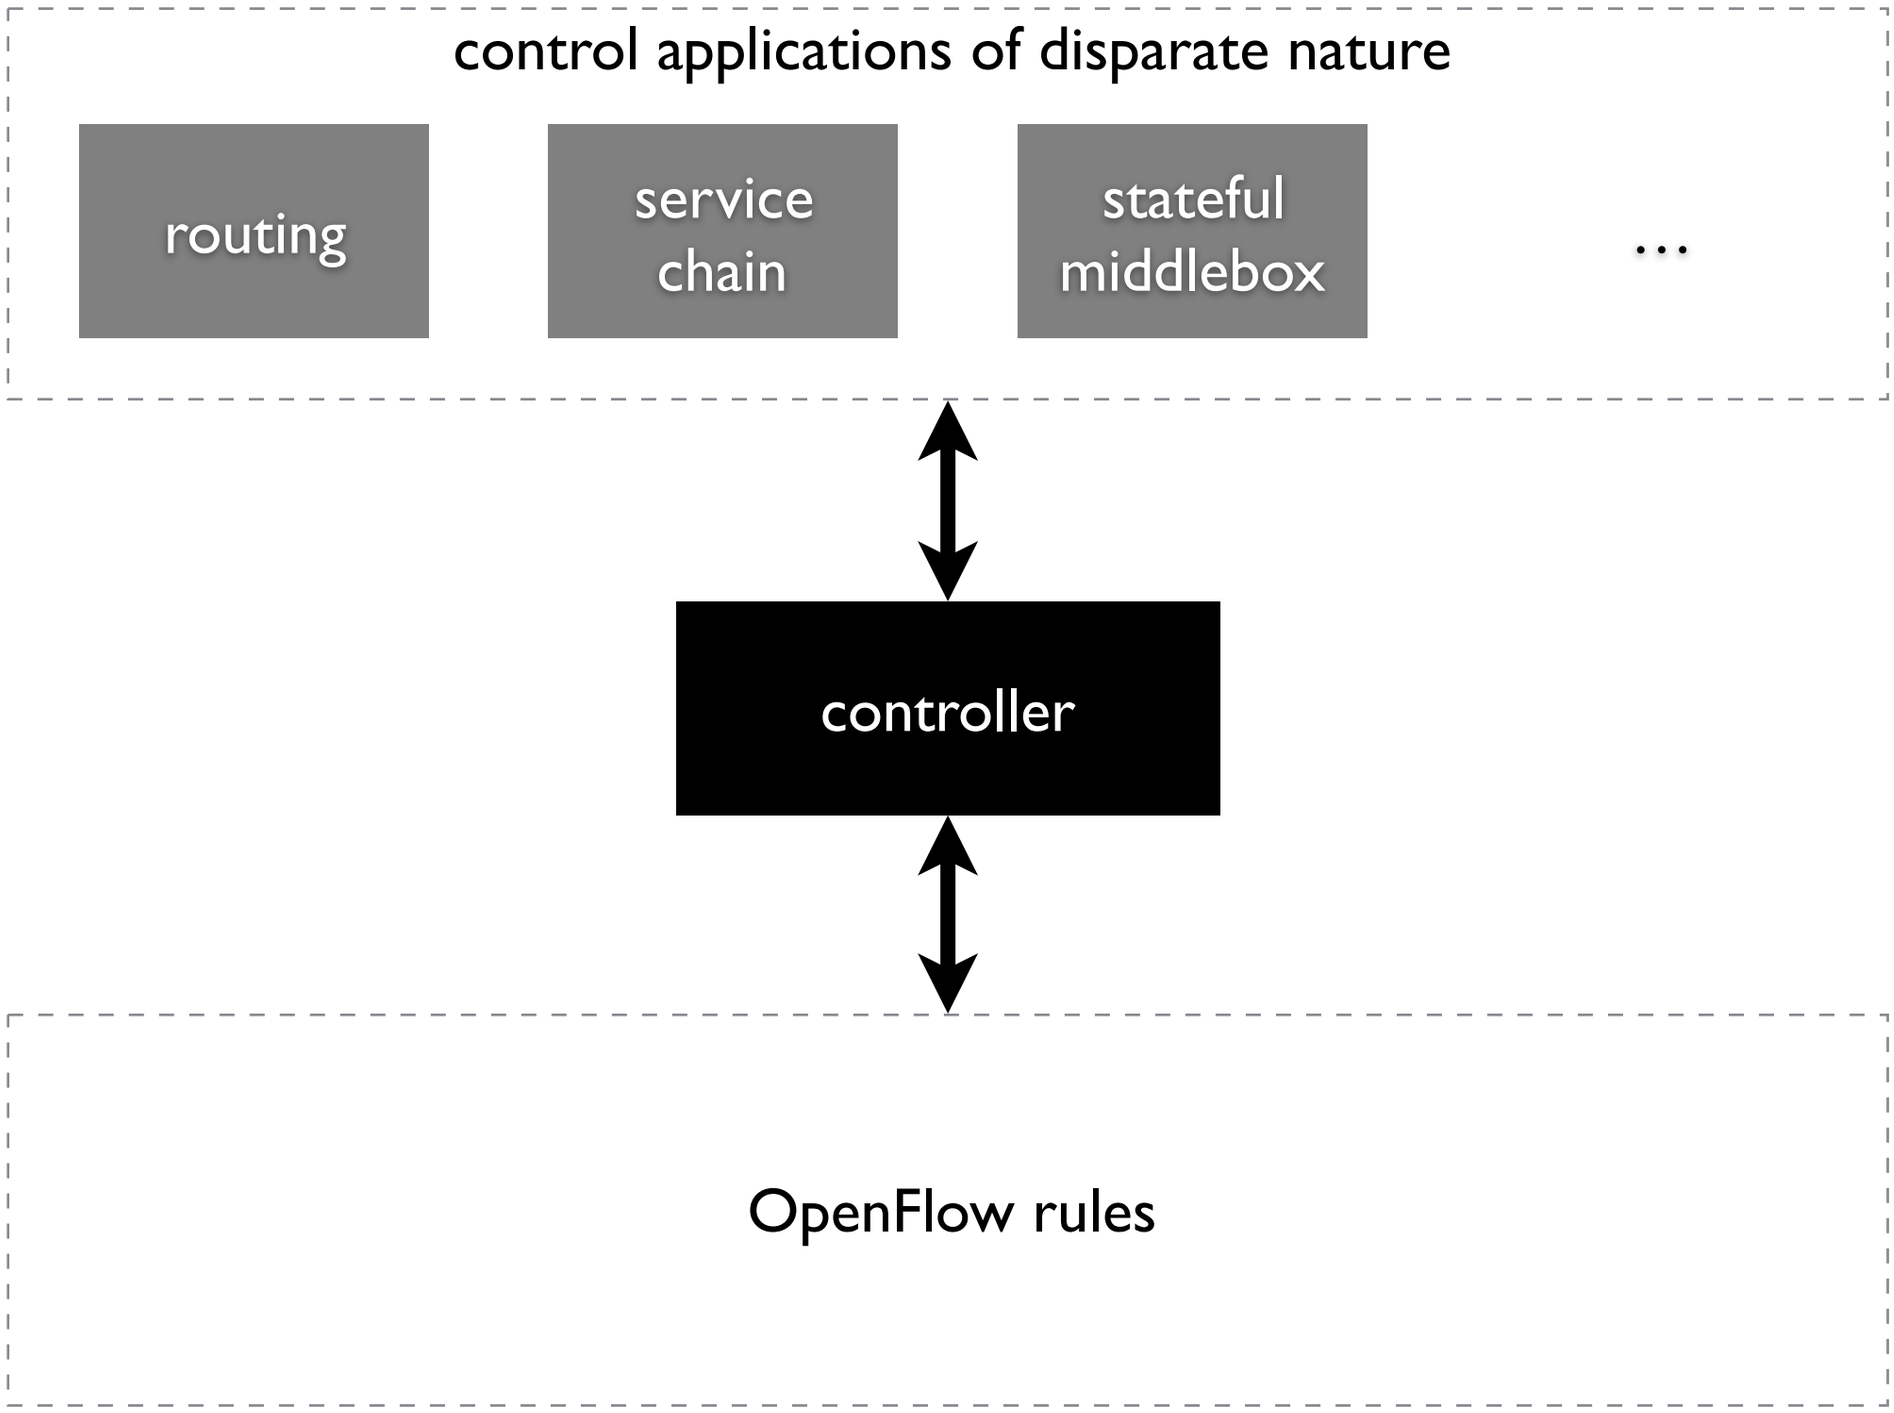
software-defined network



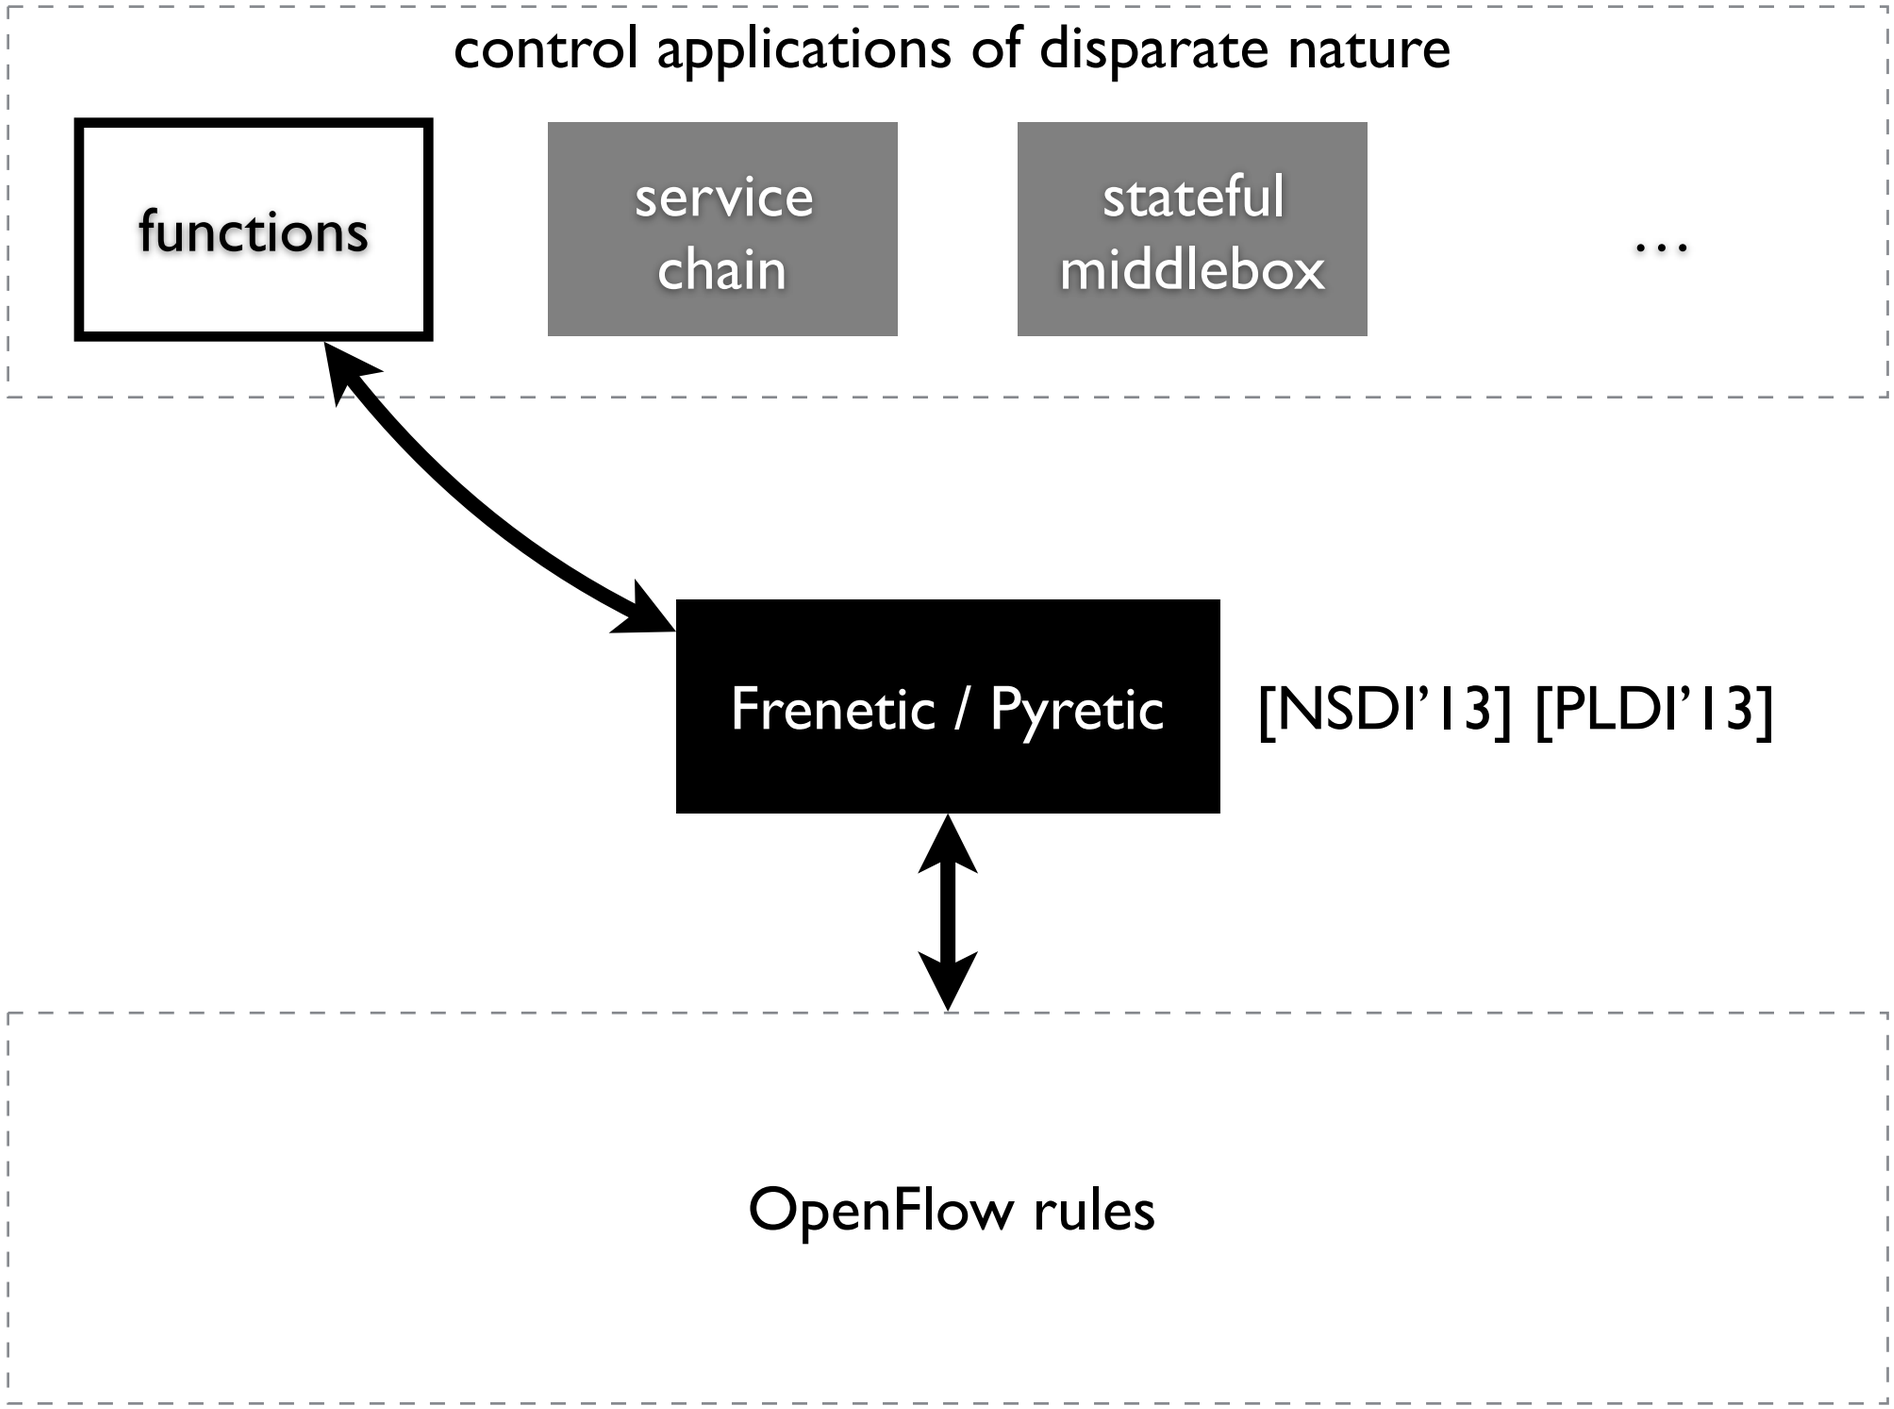
software-defined network



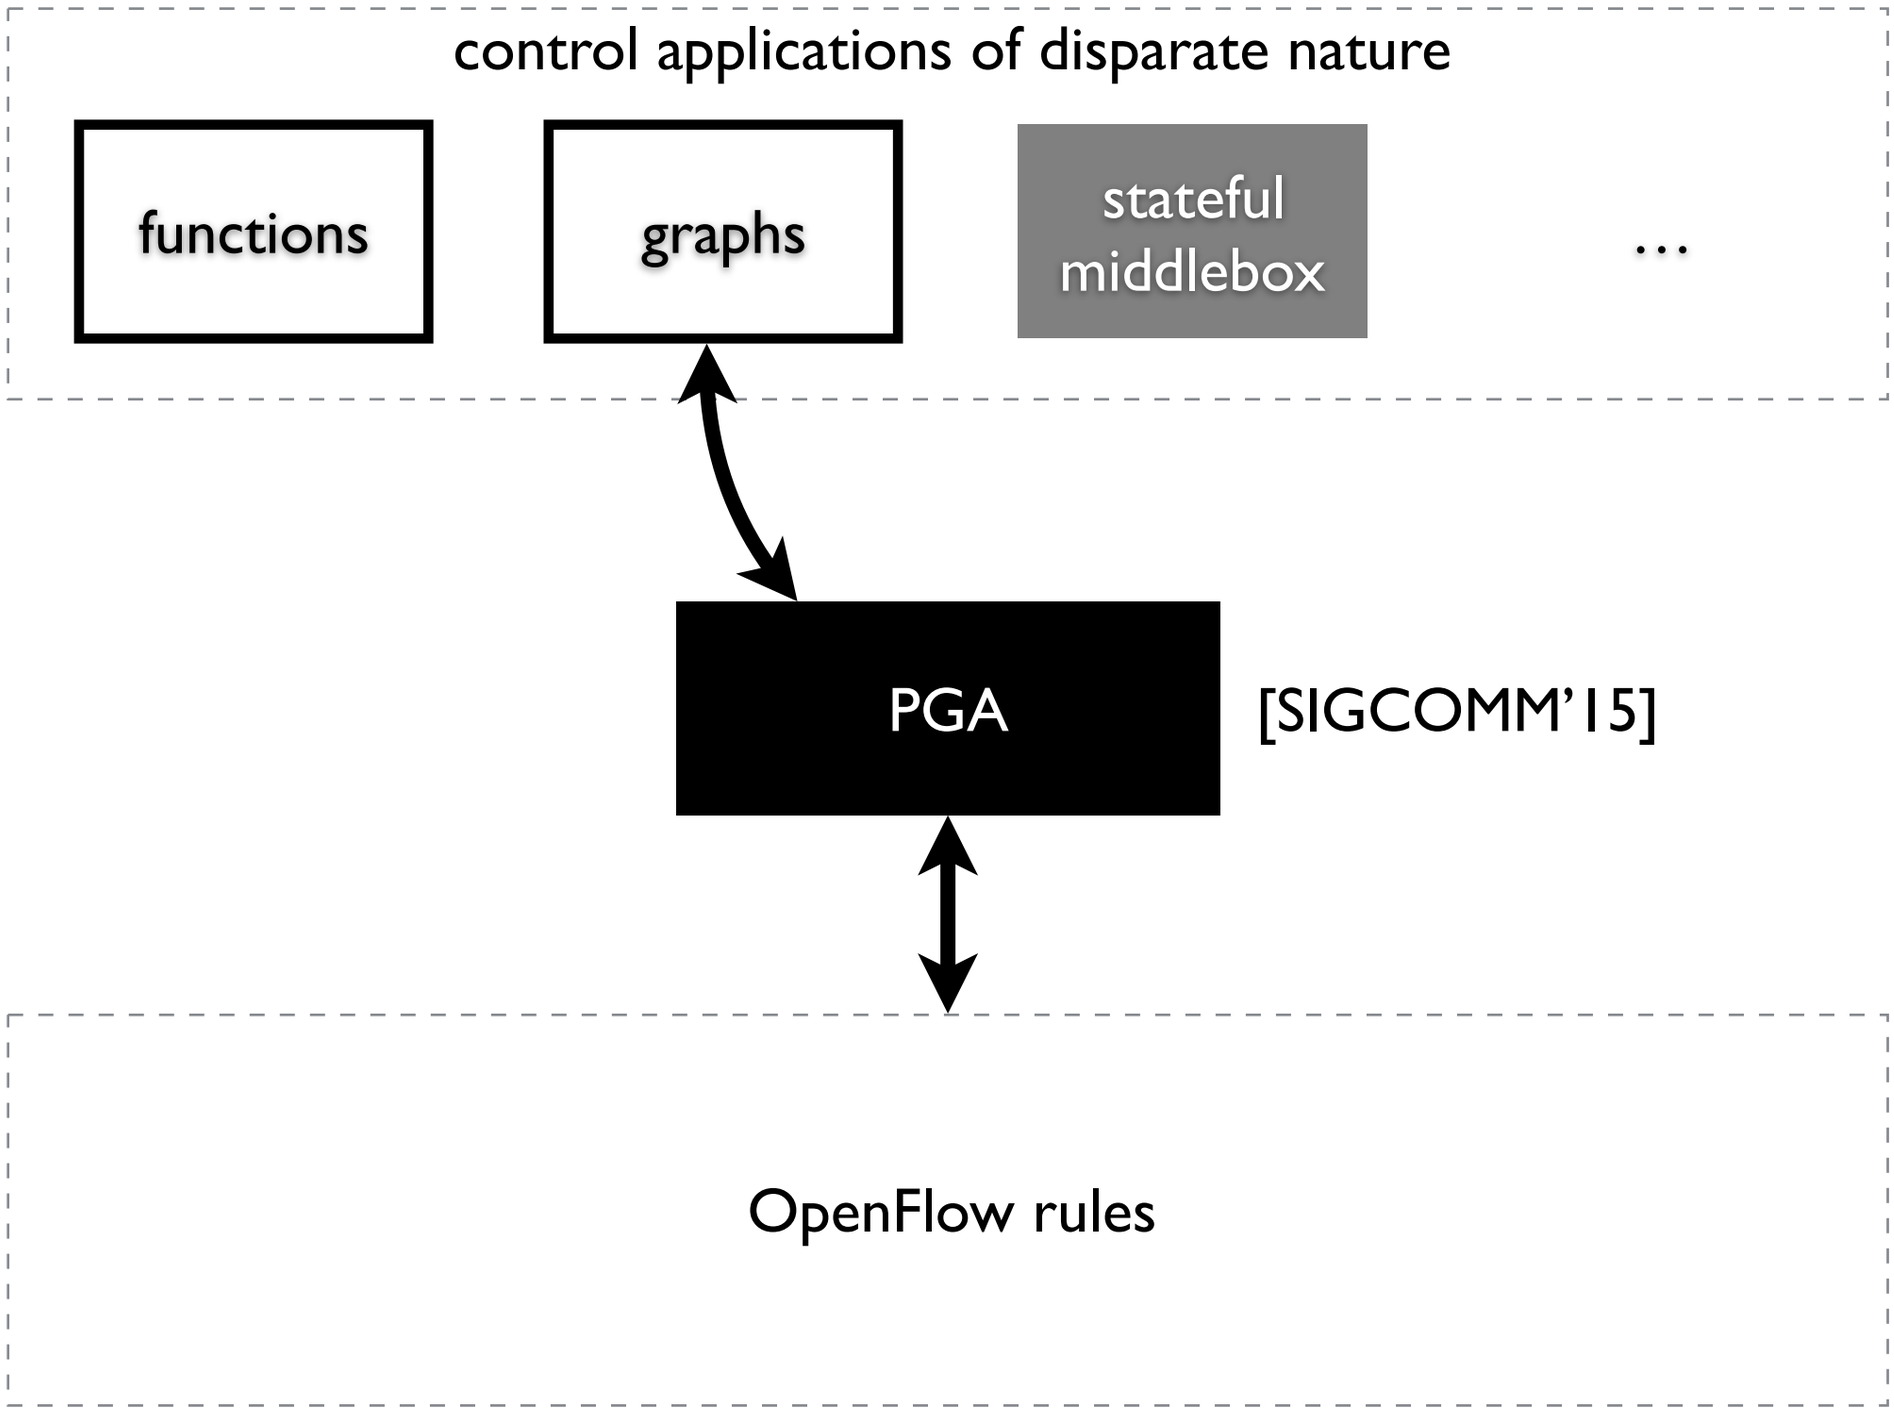
abstractions



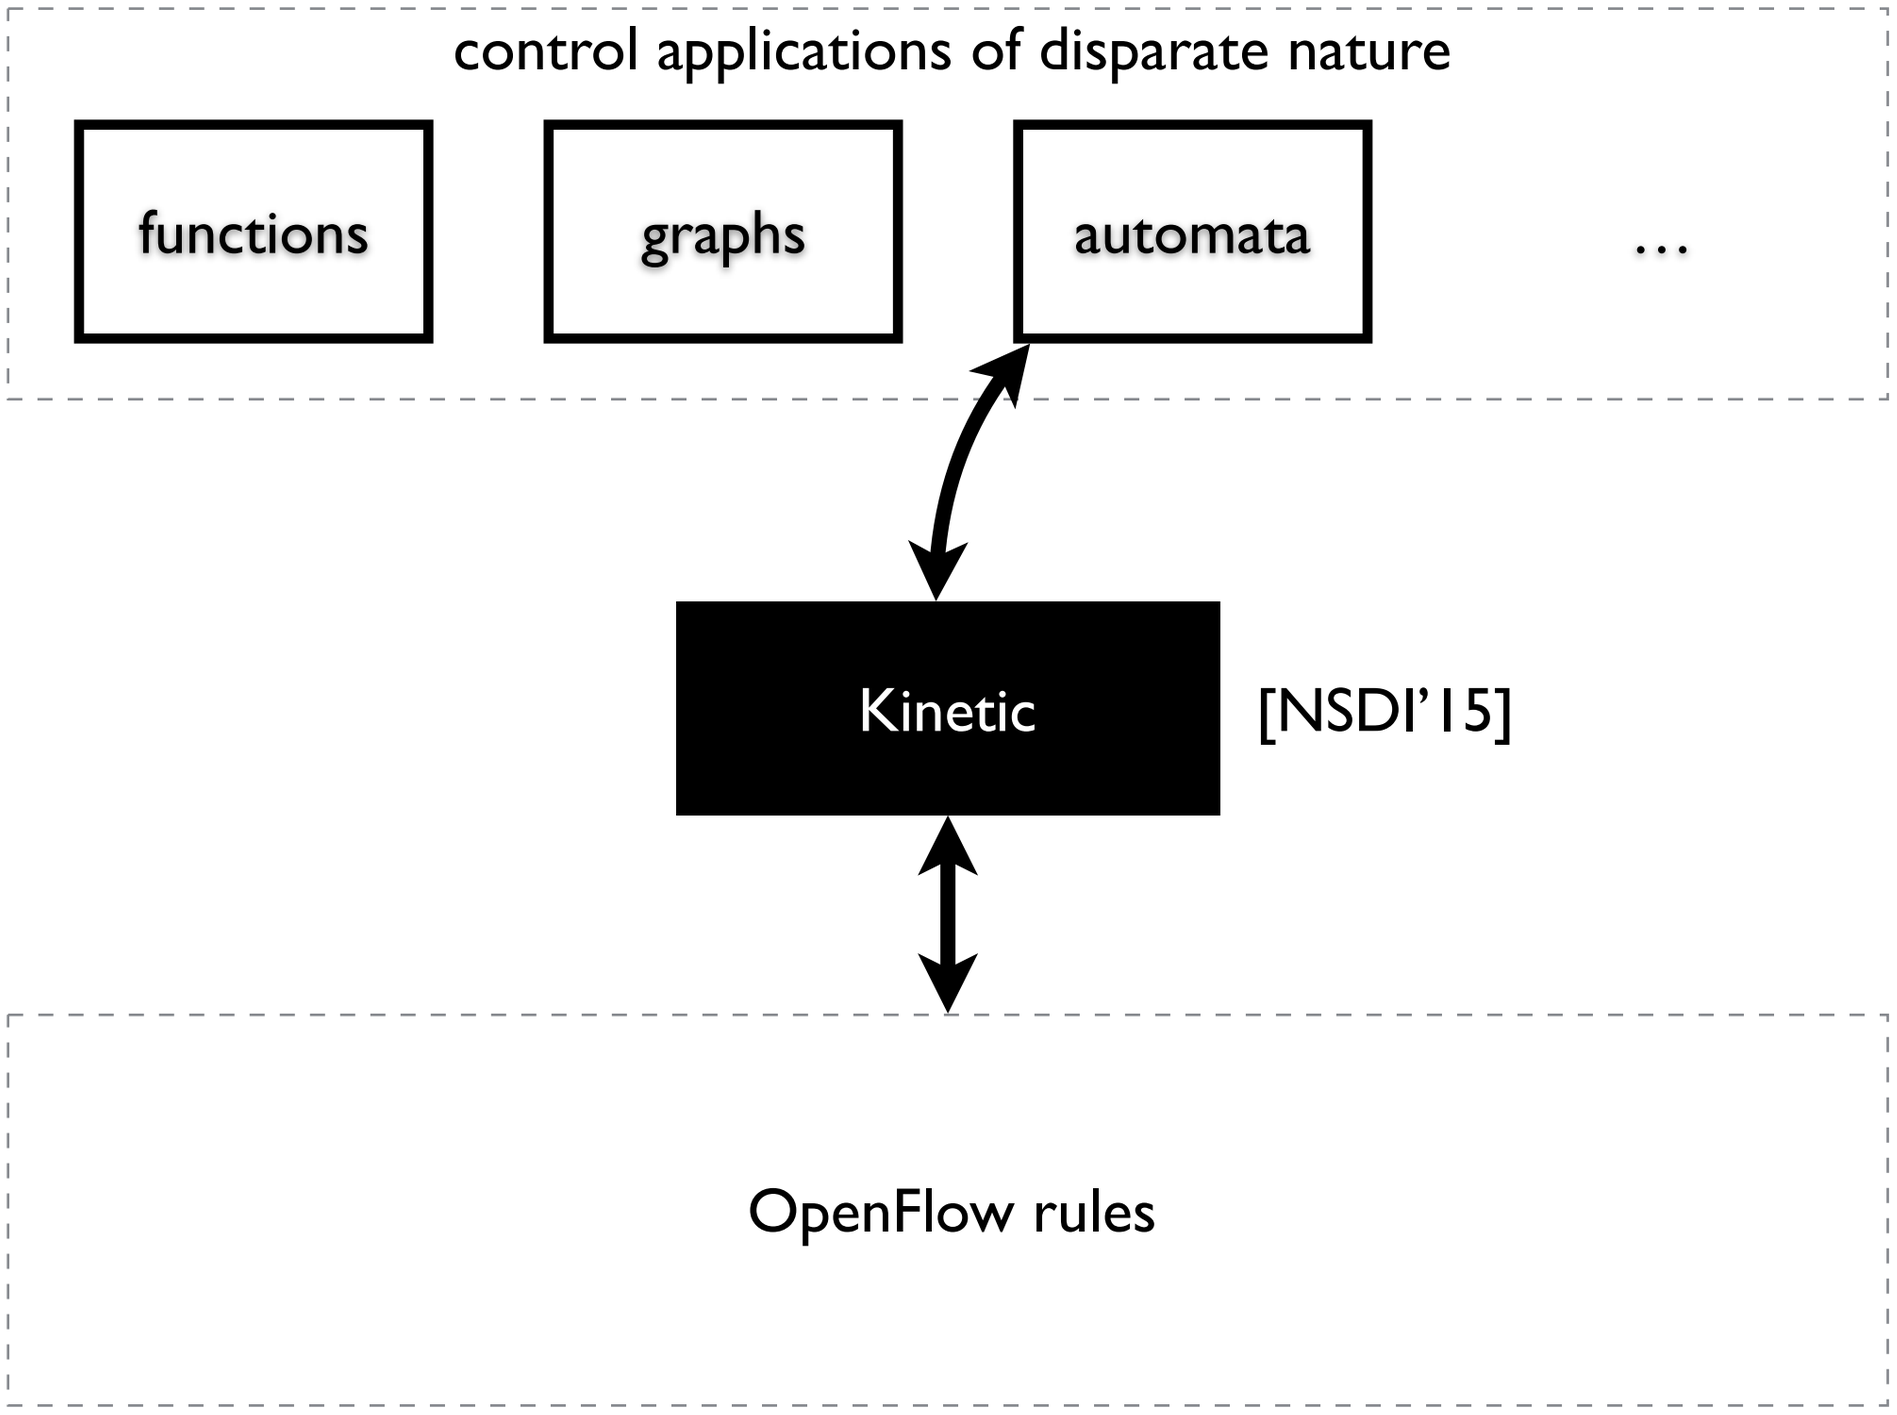
abstractions



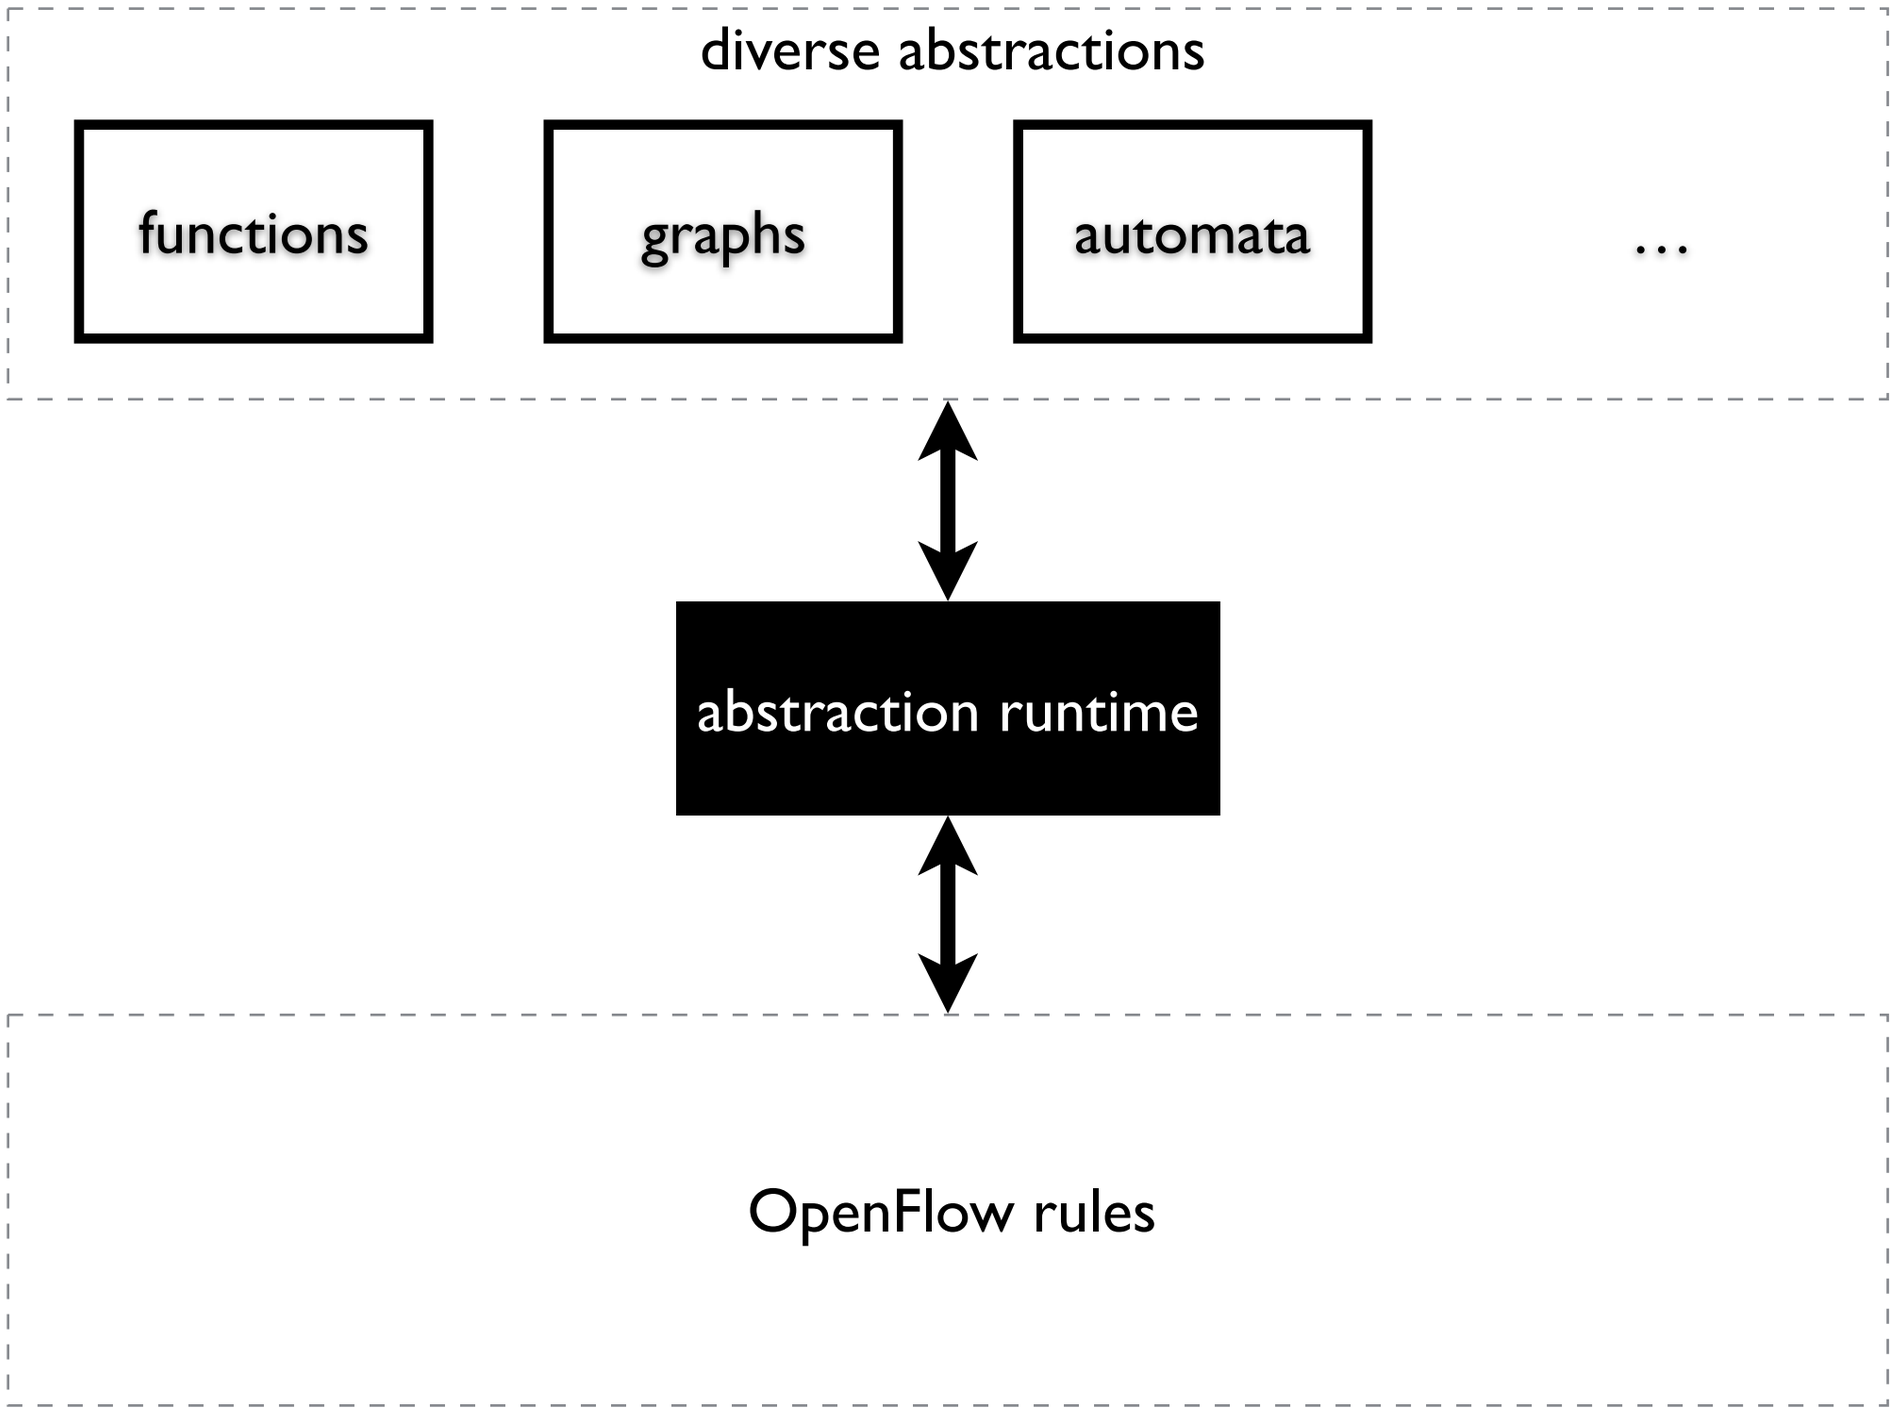
abstractions



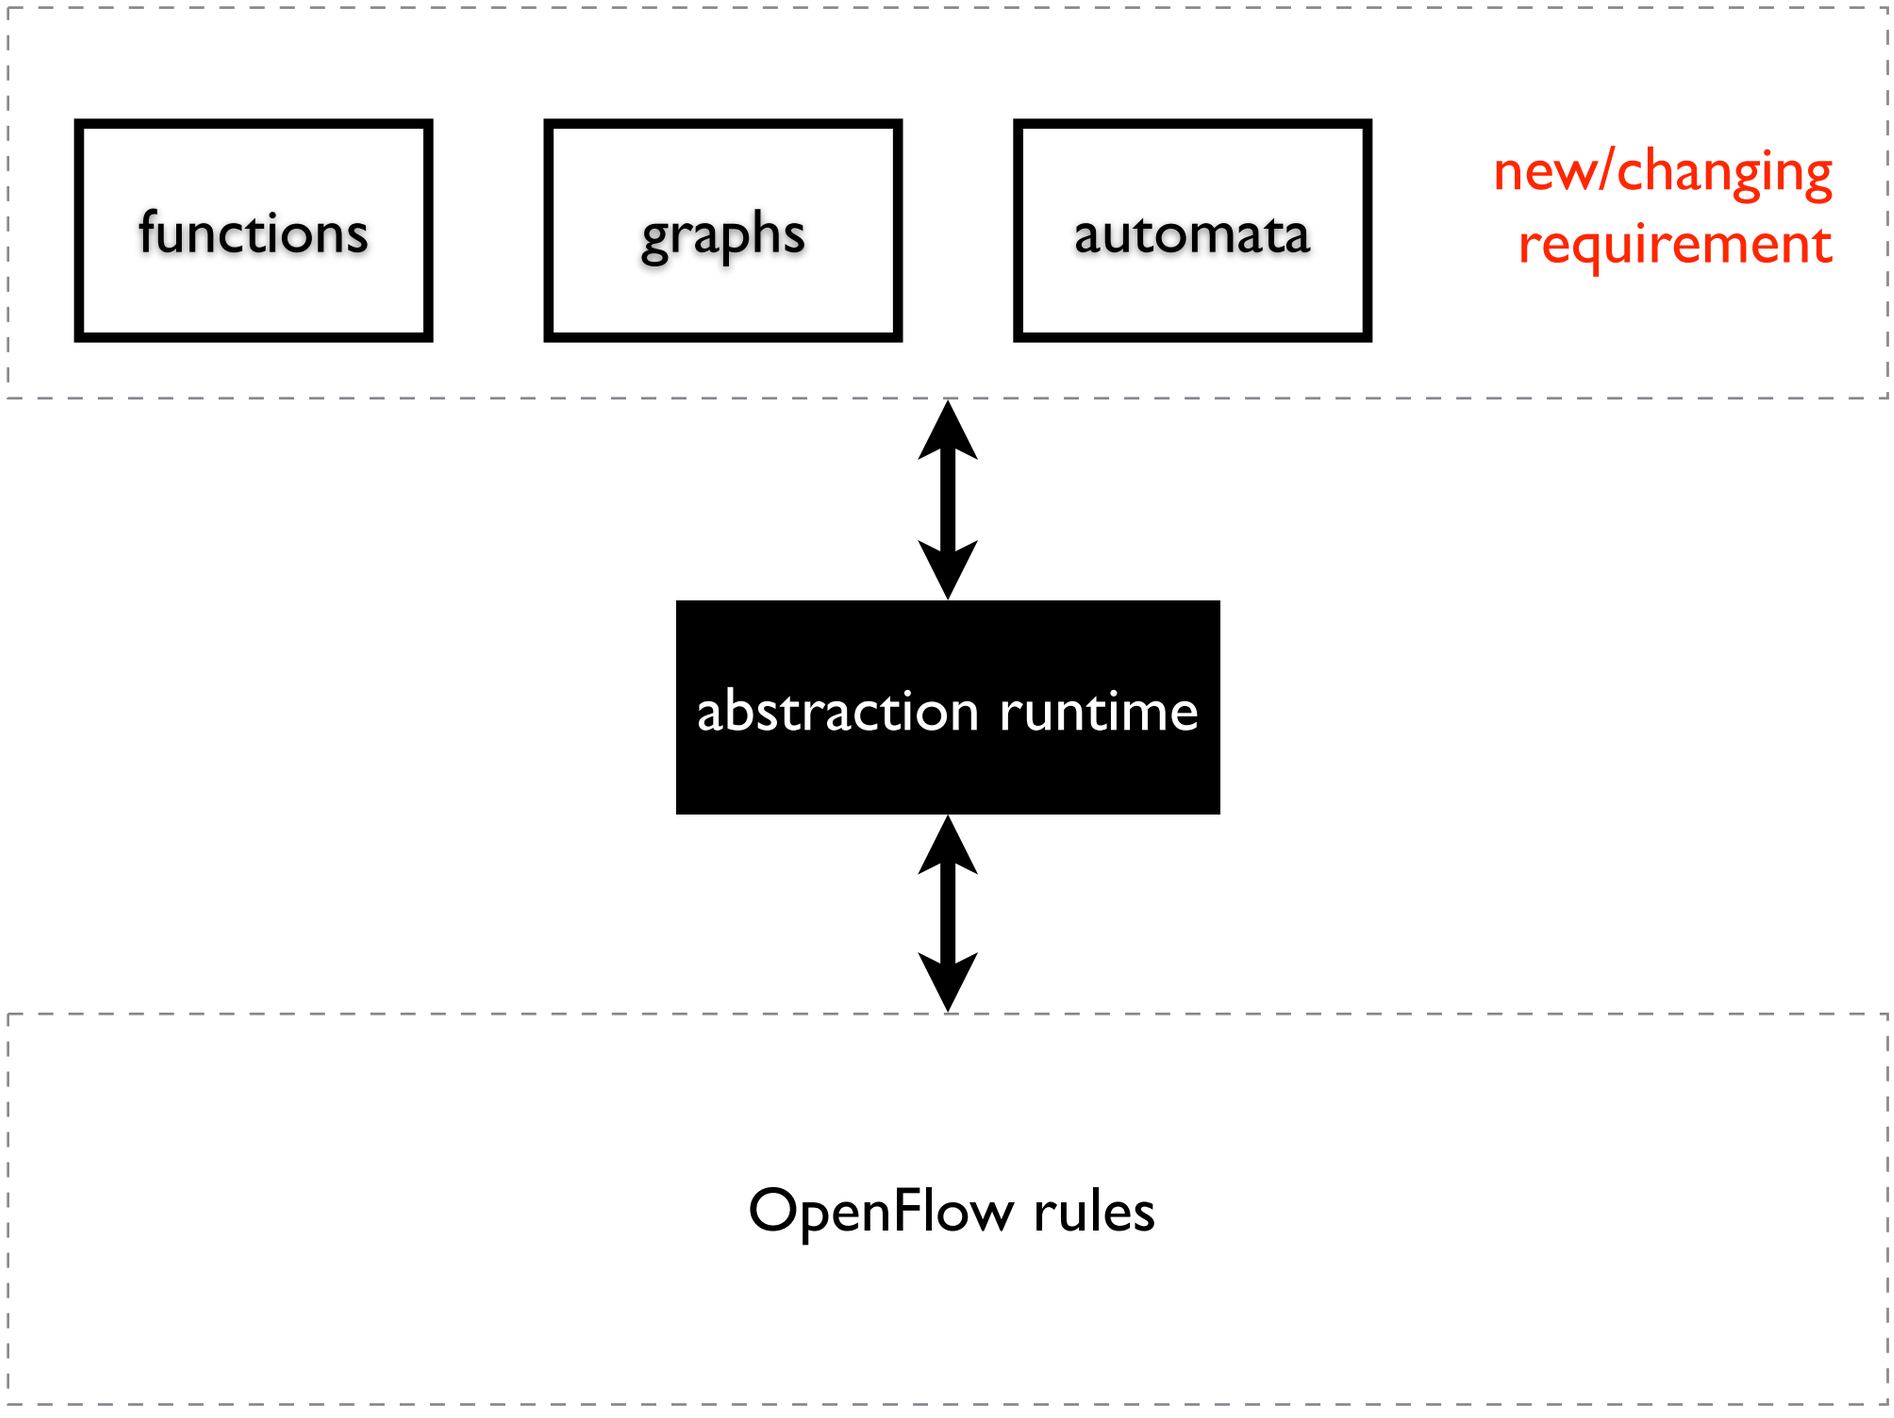
abstractions



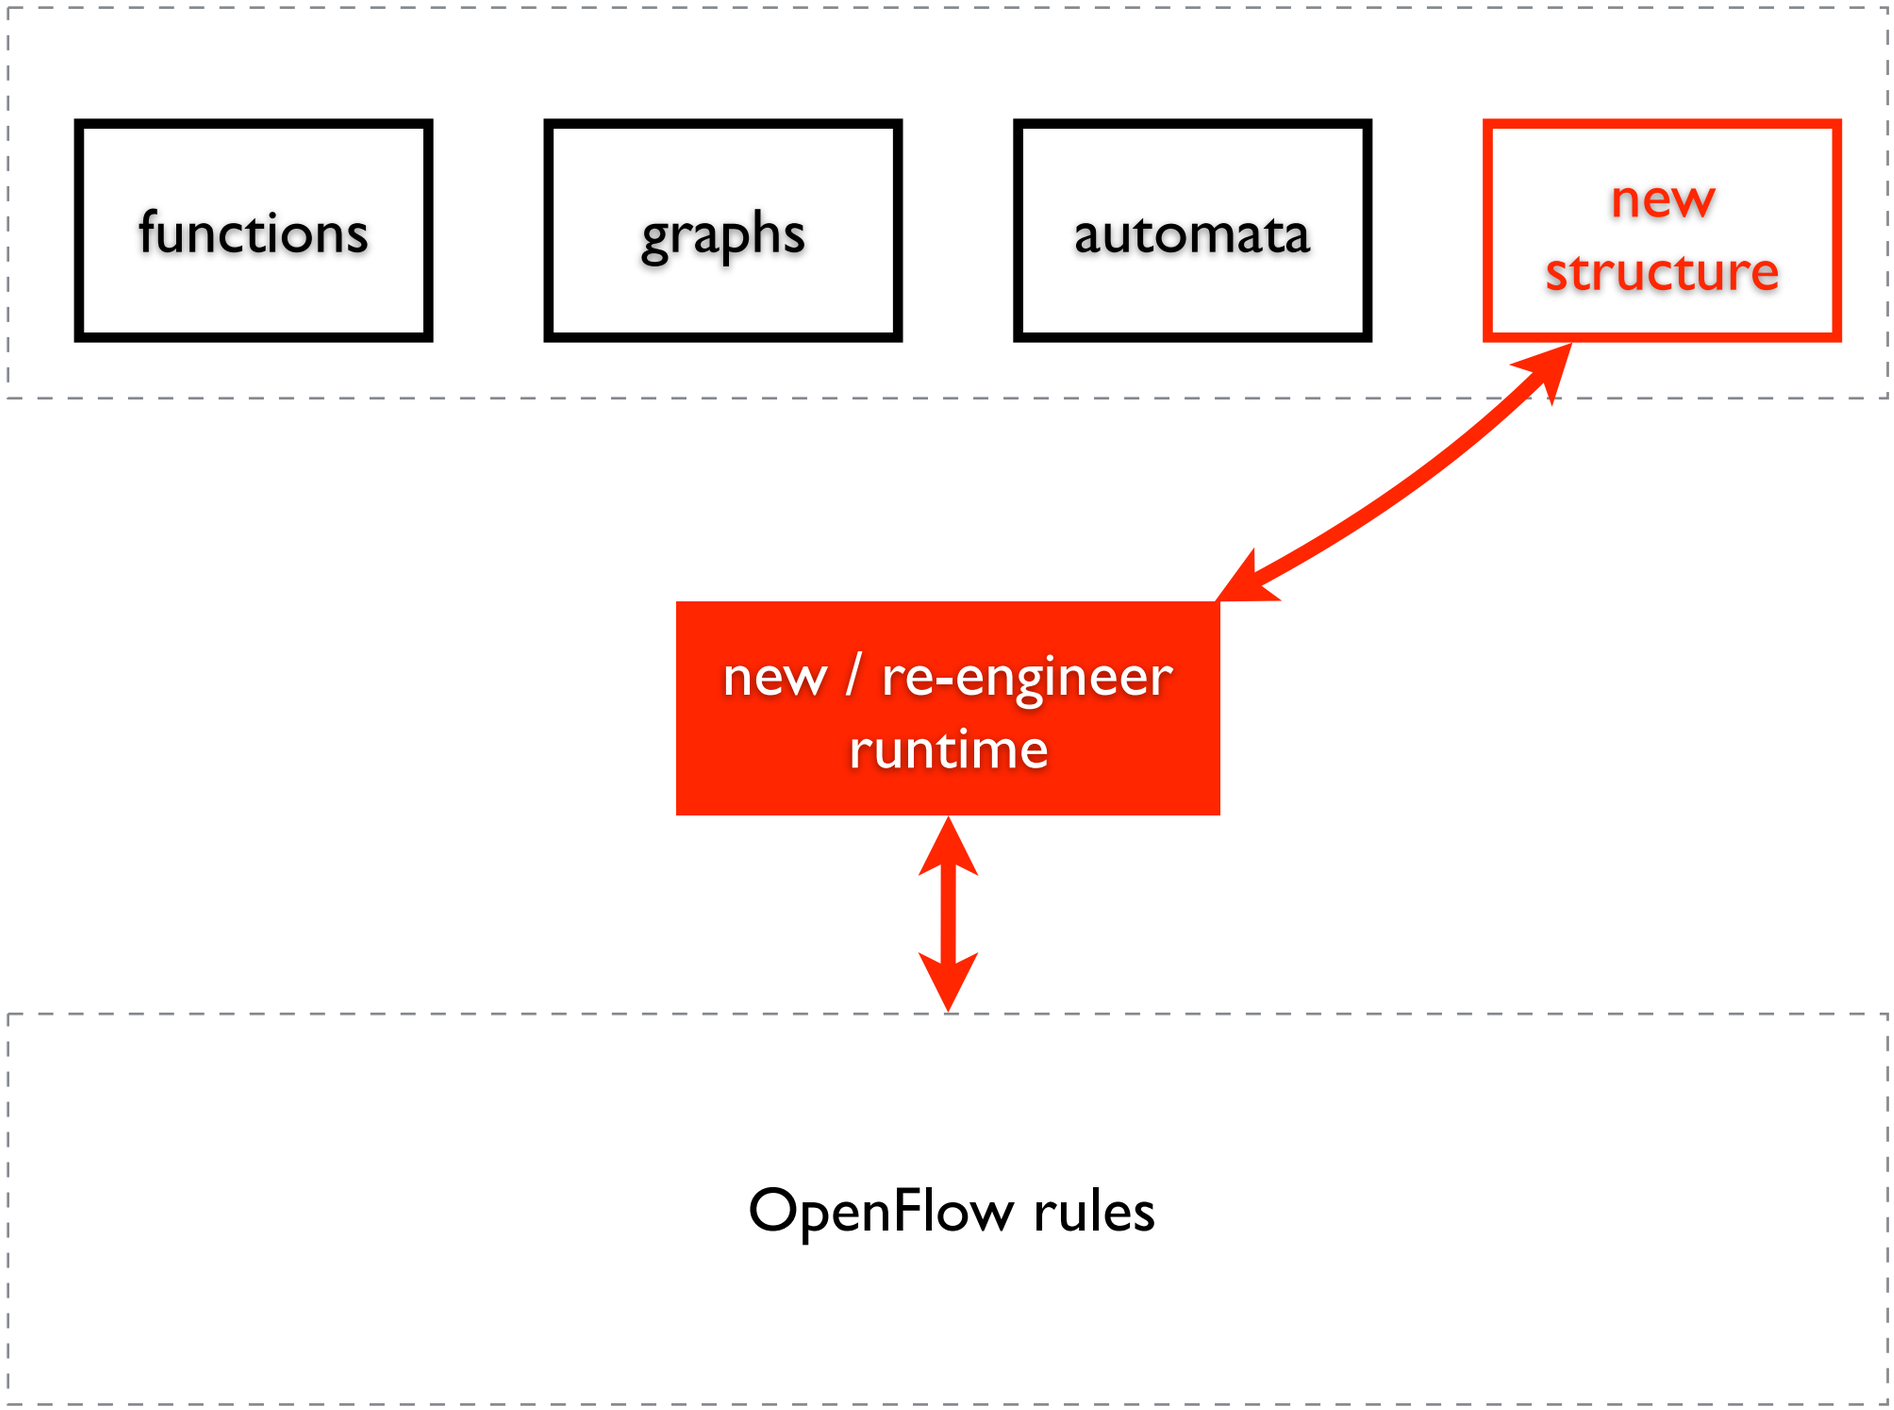
abstractions



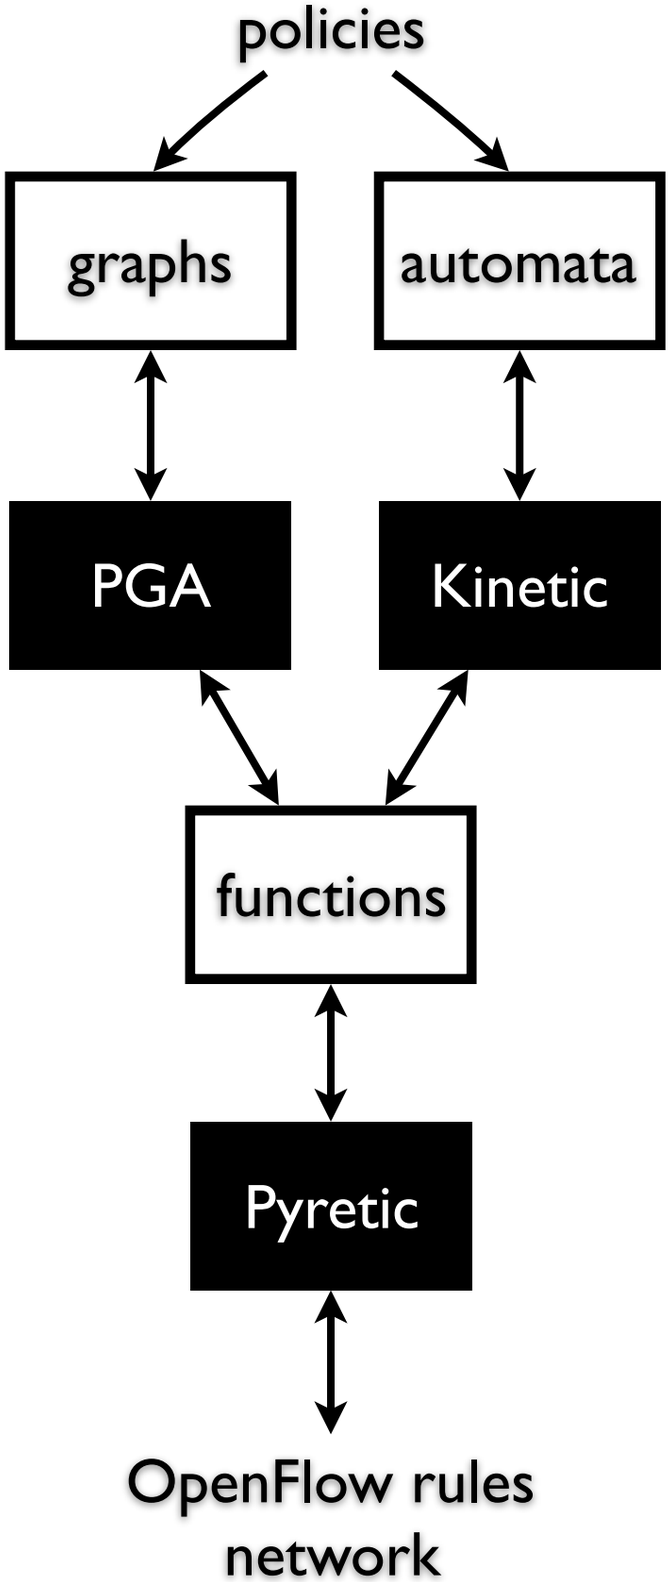
but network keeps evolving



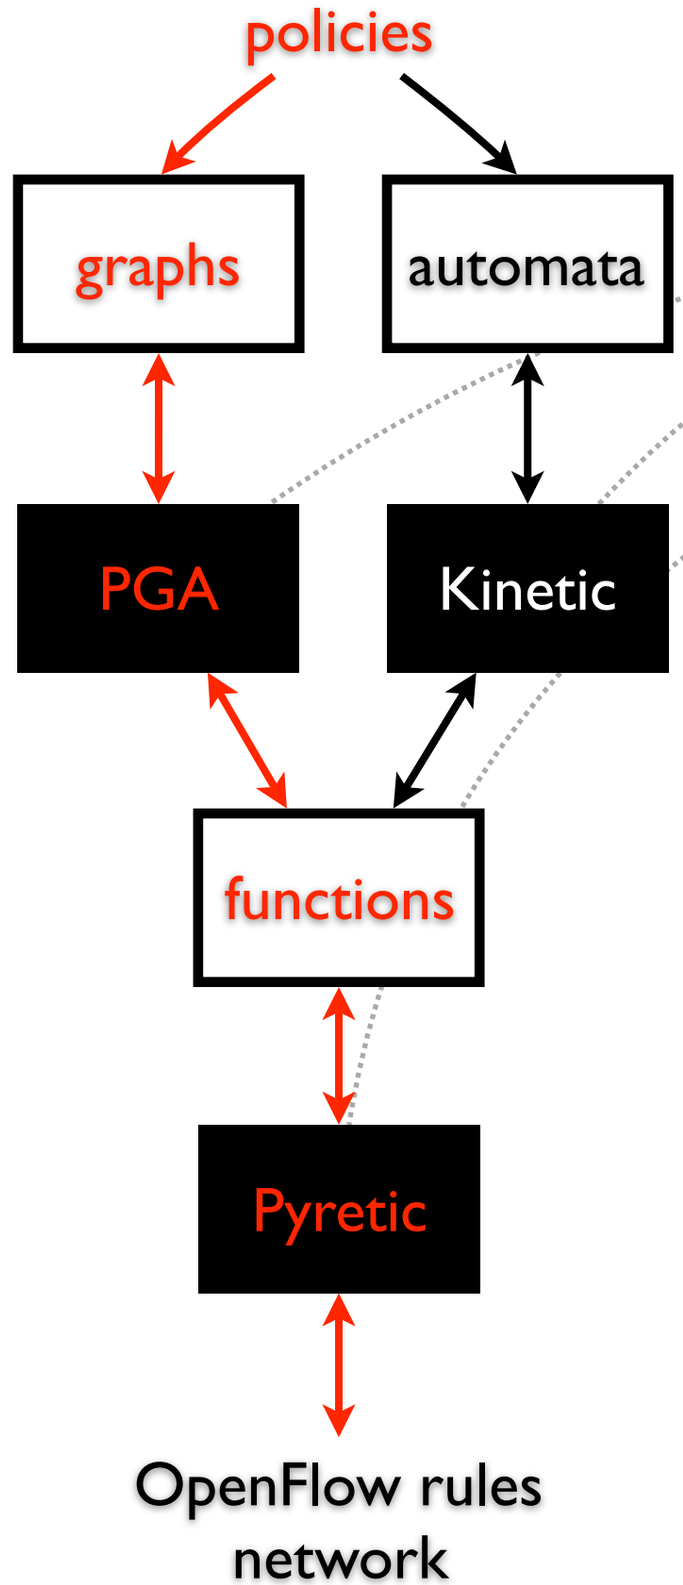
but network keeps evolving



and applications (components) interact



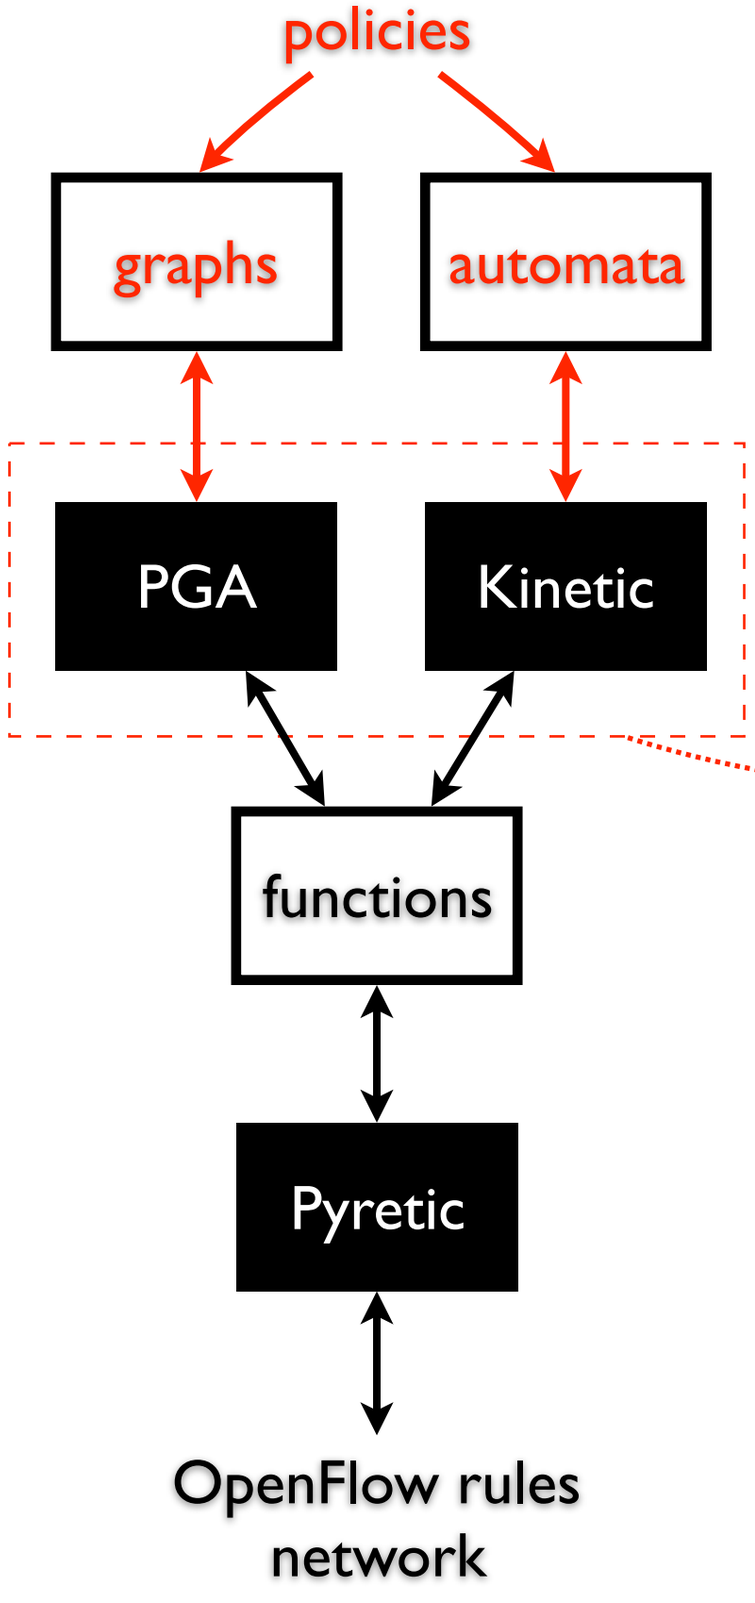
and applications (components) interact



language-level orchestration restricted to each abstraction

composing (+) policy
→ graph $+_{PGA}$ graph
→ function $+_{Pyretic}$ function

and applications (components) interact

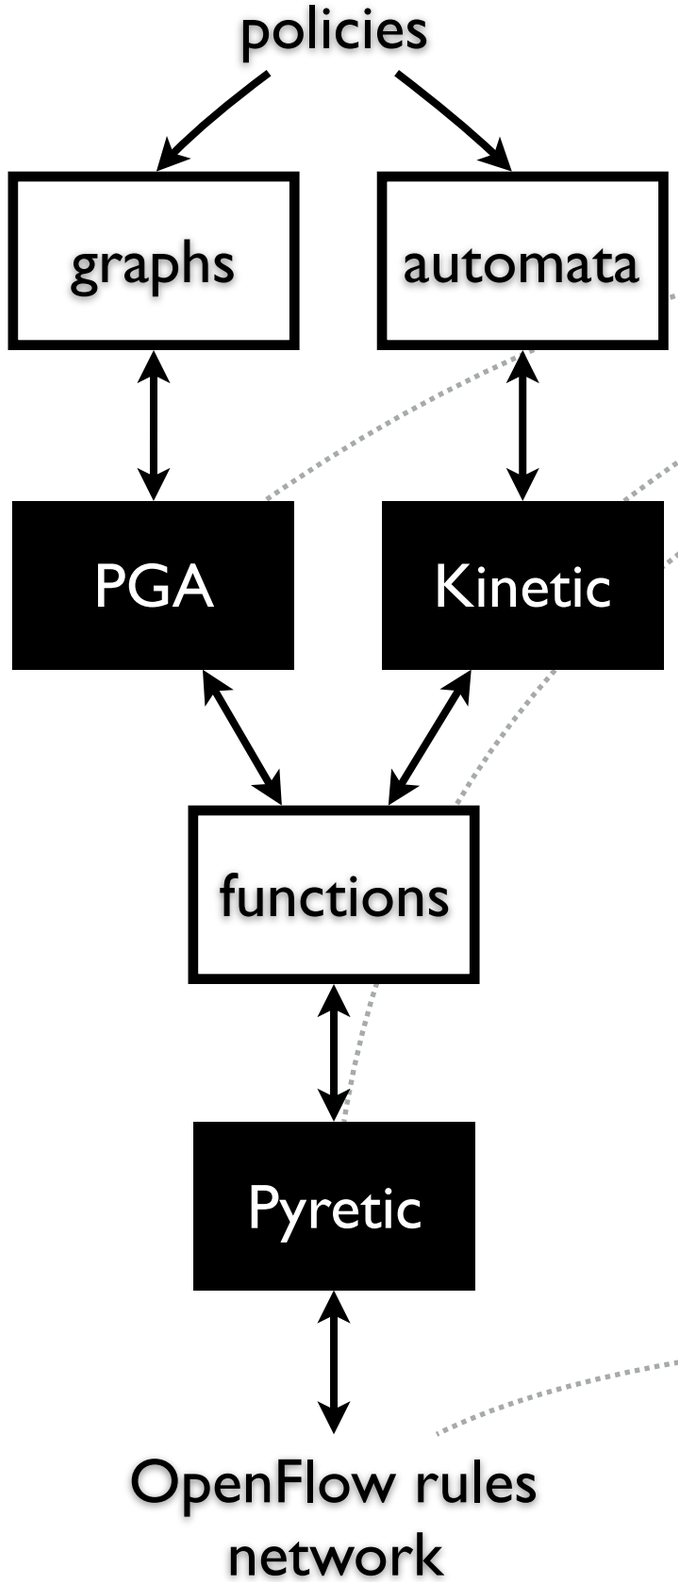


language-level orchestration restricted to each abstraction

composing (+) policy
→ graph +? automata

integrate the runtime, hard-wiring internals?

and applications (components) interact



language-level orchestration restricted to each abstraction

abstraction-agonistic coordination often low-level
Co-visor [NSDI'15] statesman [SIGCOMM'14]

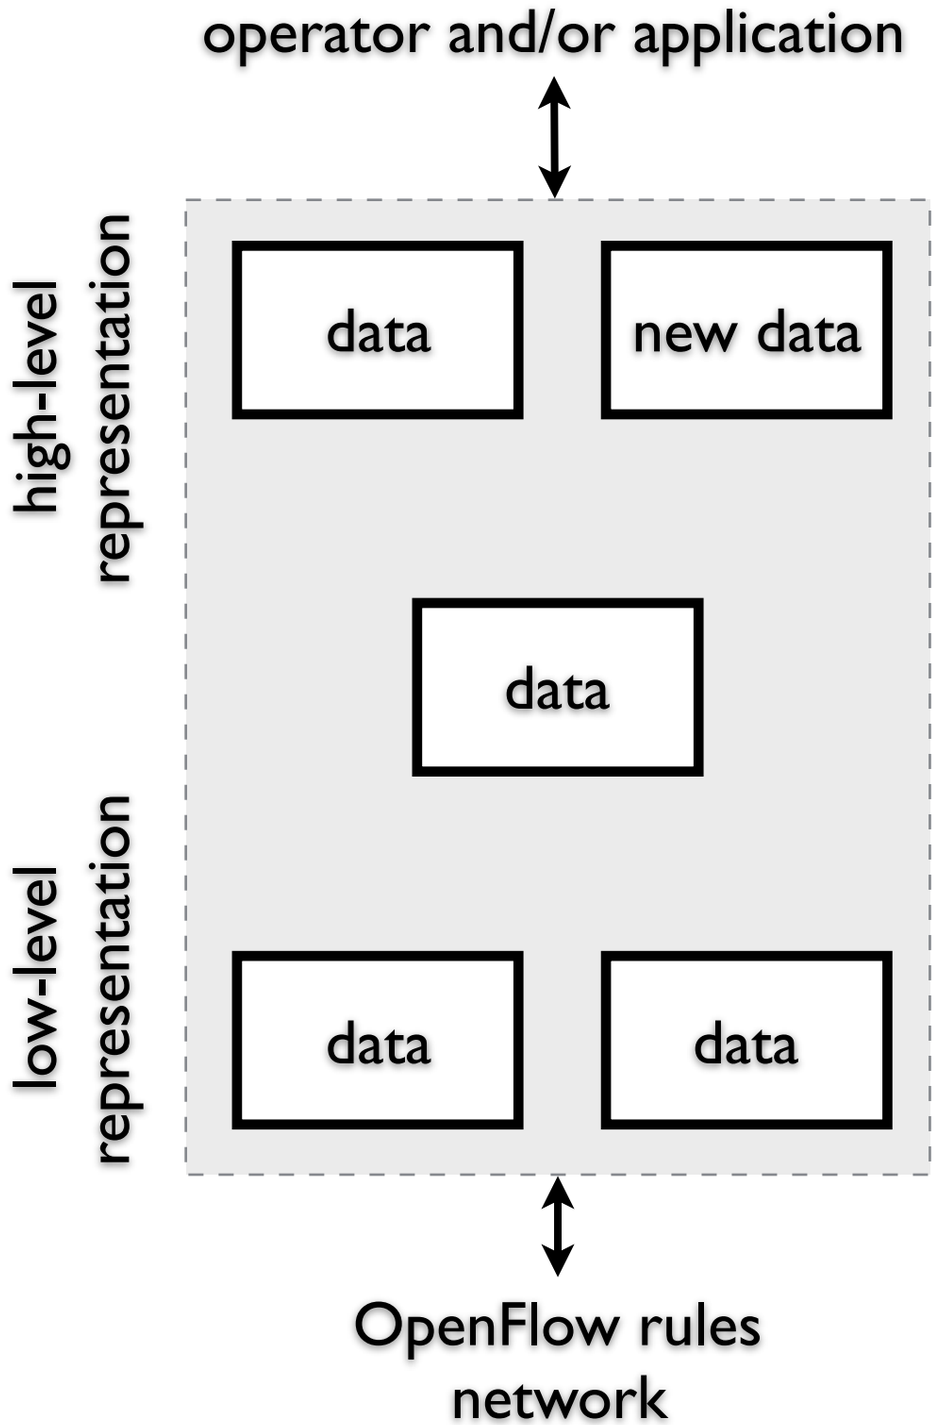
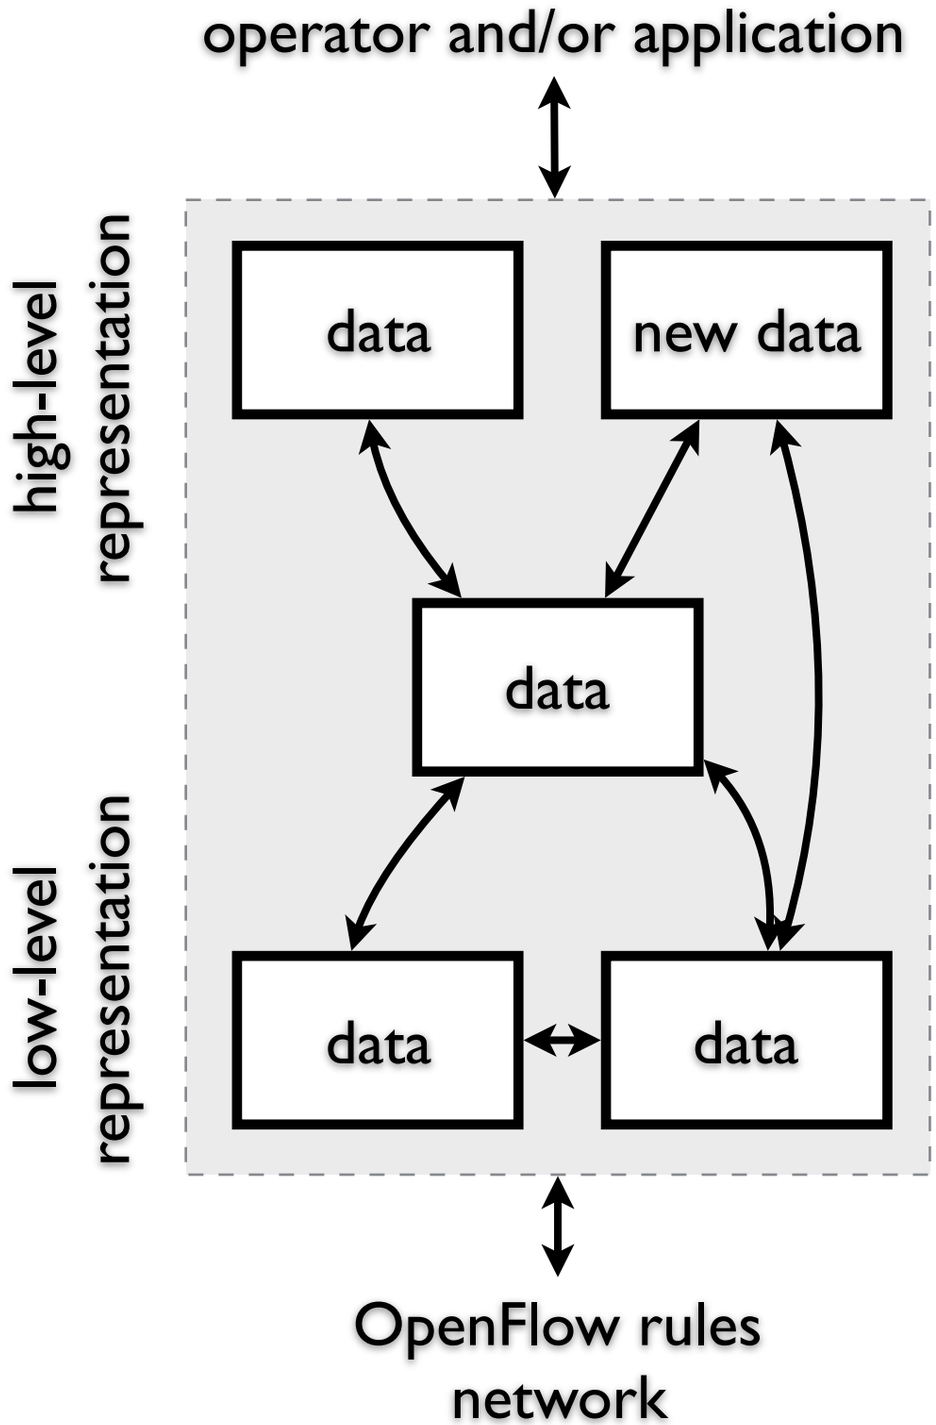
our perspective



SDN control revolves around data representation

- discard specialized, pre-compiled, fixed structures
- adopt a *plain data representation*

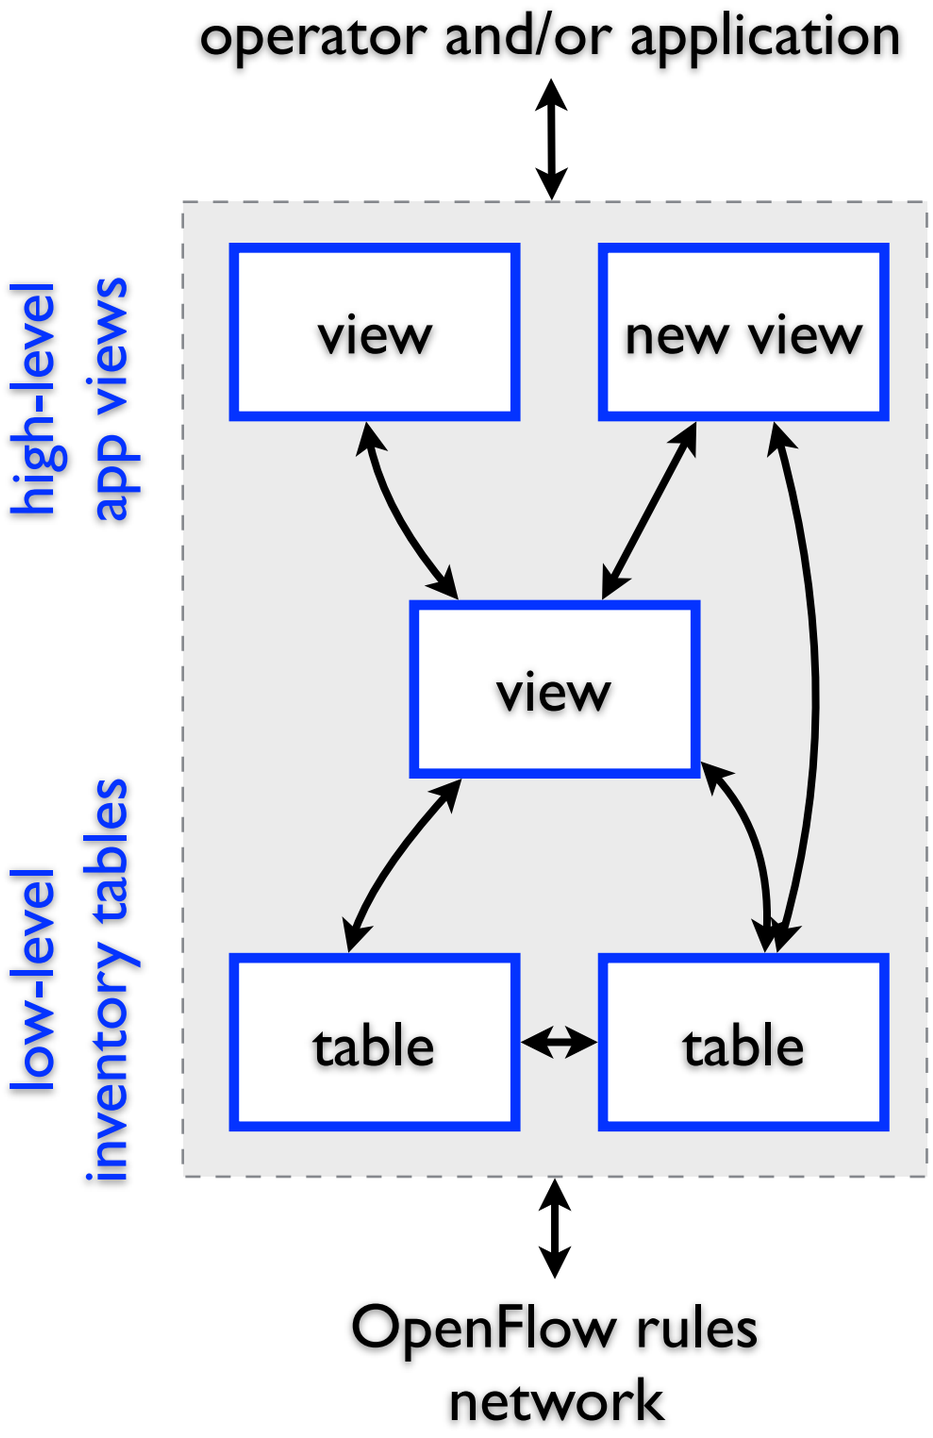
our perspective



SDN control revolves around data representation

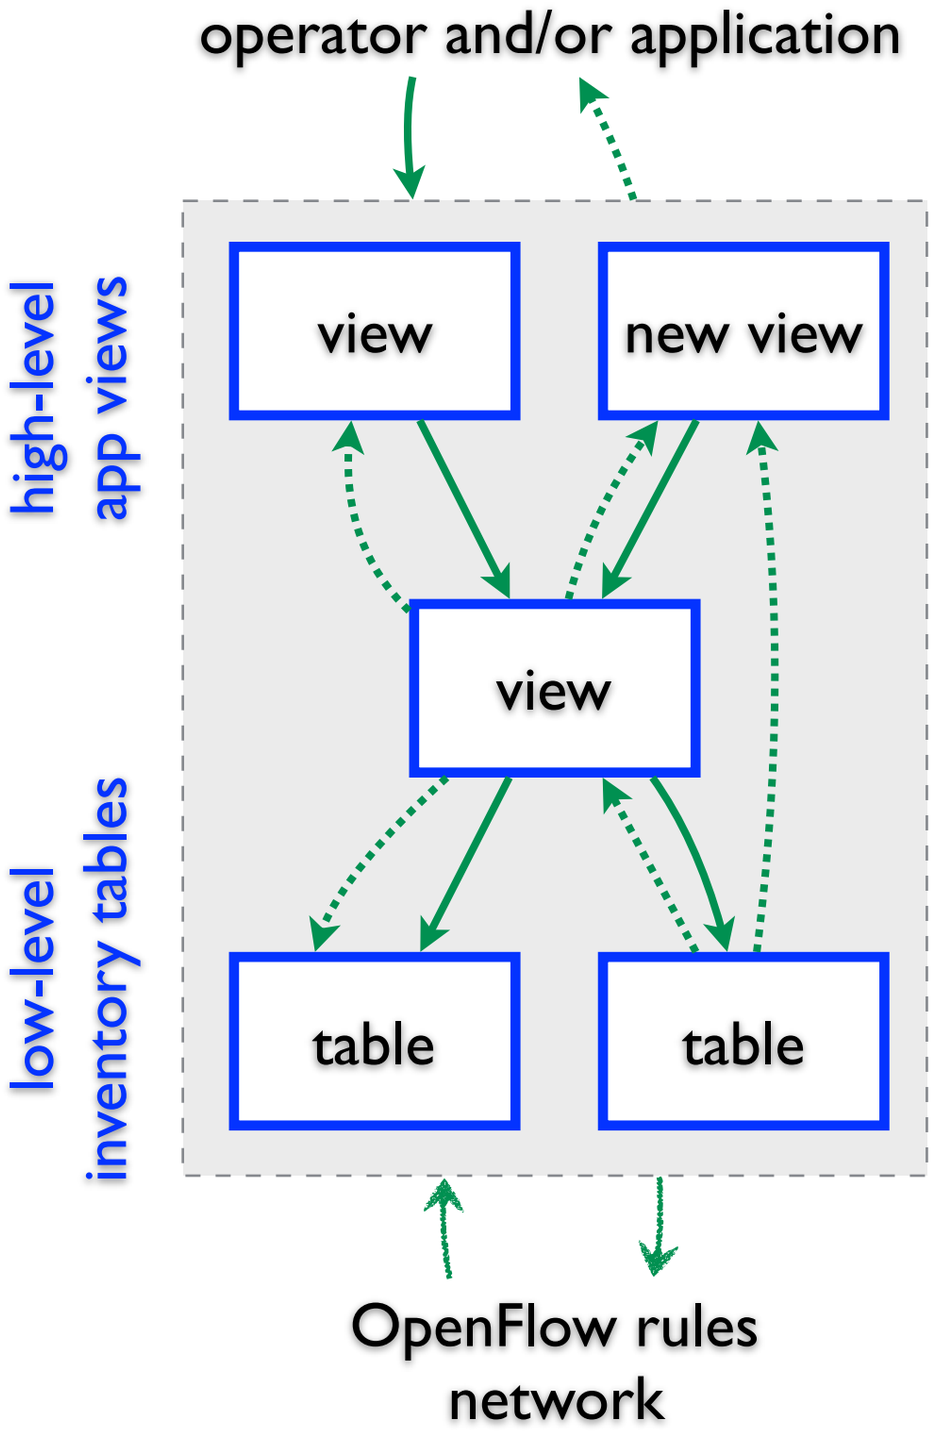
- discard specialized, pre-compiled, fixed structures
- adopt a *plain data representation*
- use a *universal data language*

a database-defined network



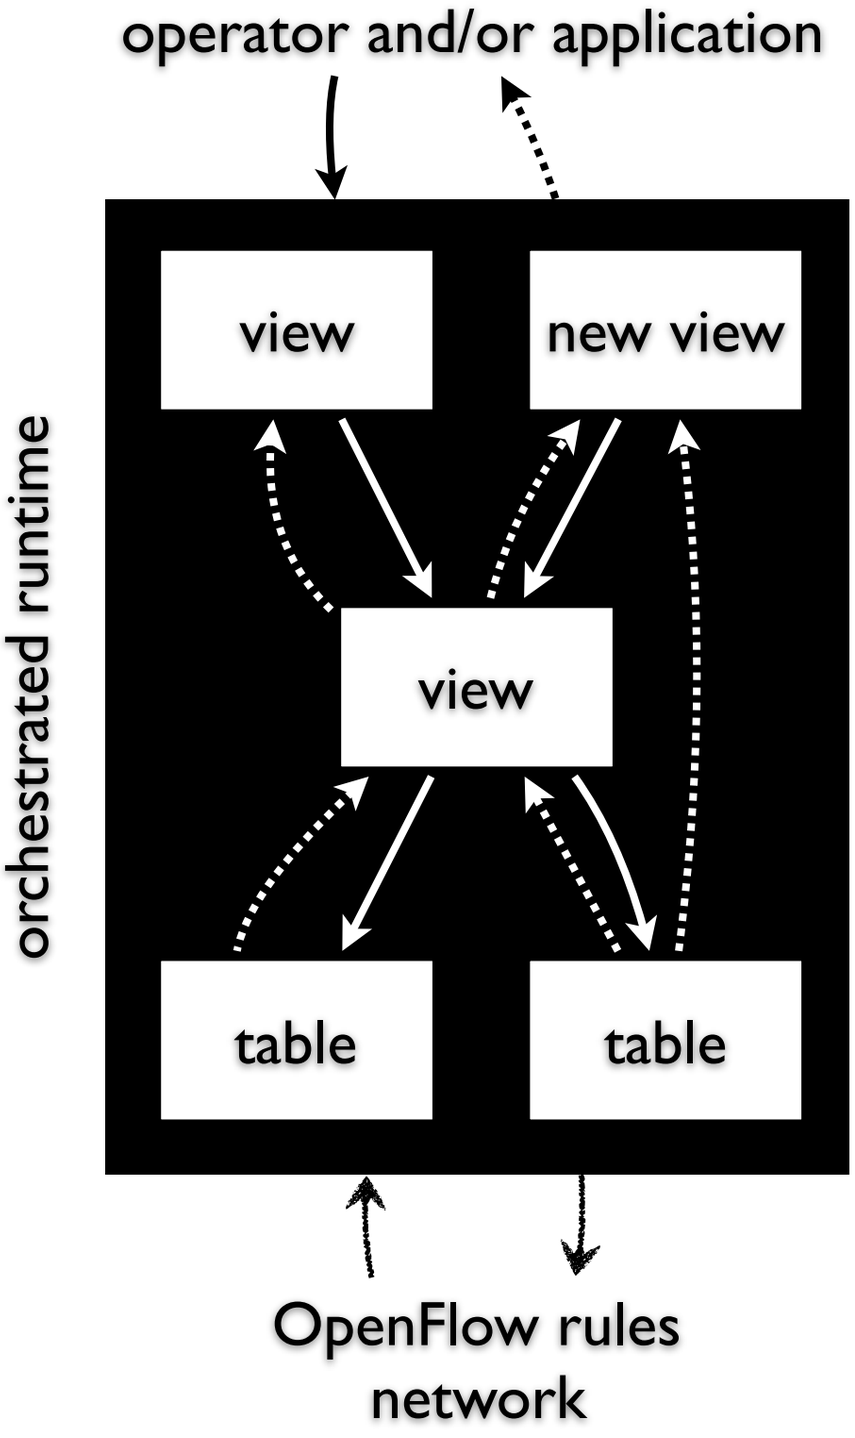
- relation — the plain data representation
  - table — stored relation
  - view — virtual relation

a database-defined network



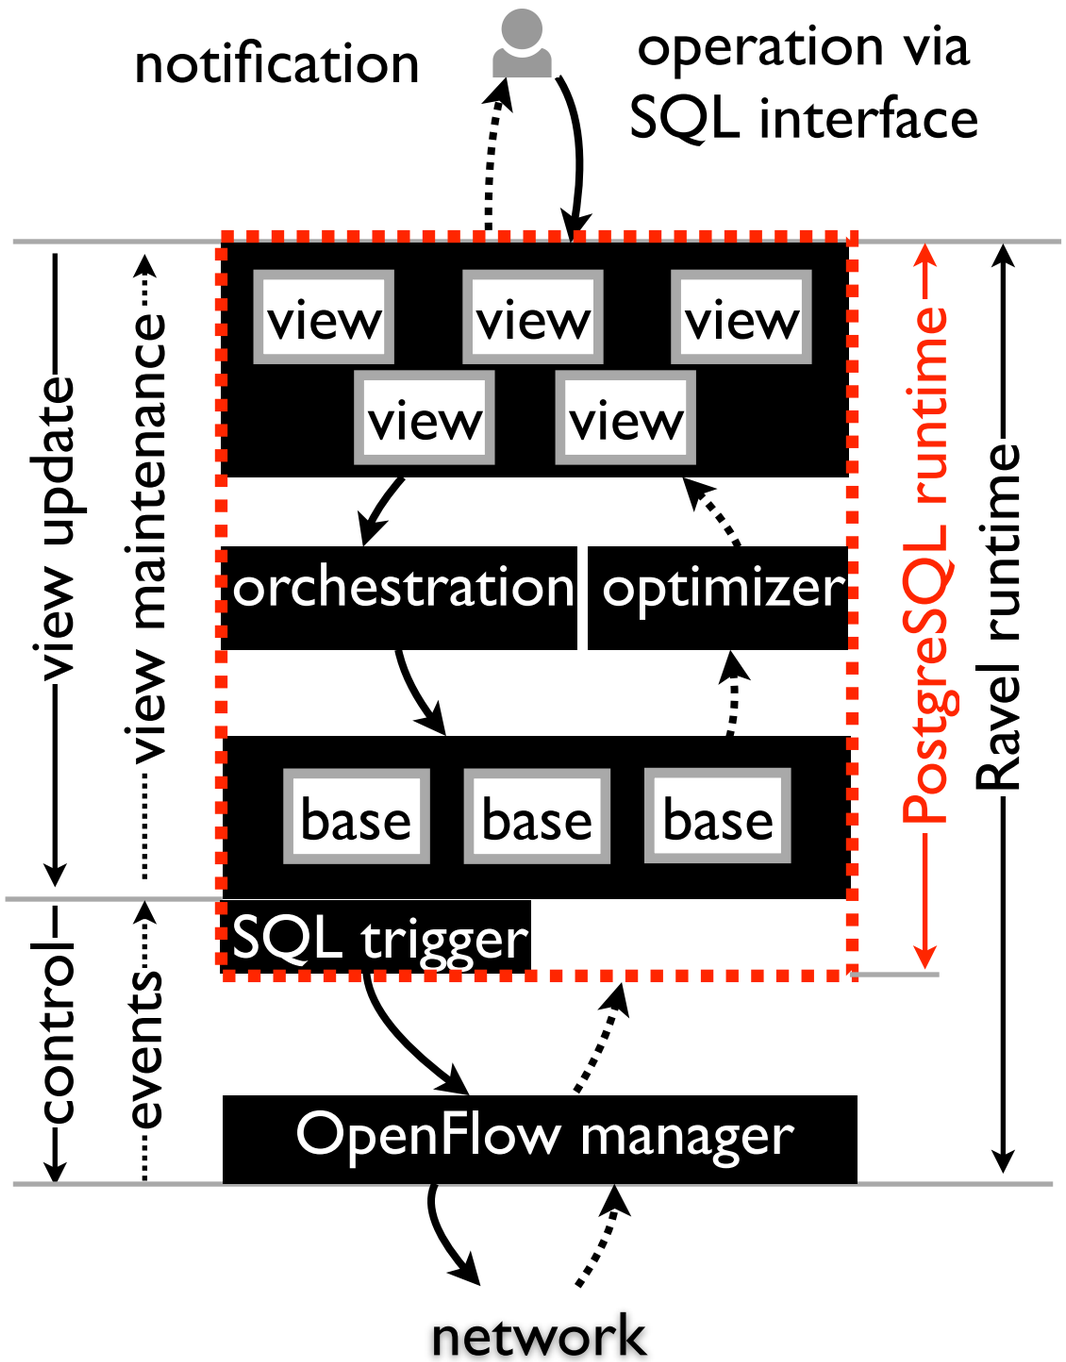
- relation — the plain data representation
  - table — stored relation
  - view — virtual relation
- SQL — the universal data language
  - query, update, trigger, rule

a database-defined network



- relation — the plain data representation
  - table — stored relation
  - view — virtual relation
- SQL — the universal data language
  - query, update, trigger, rule
- SQL database — the high-performance runtime
  - orchestration challenge: refine runtime behavior by data mediation

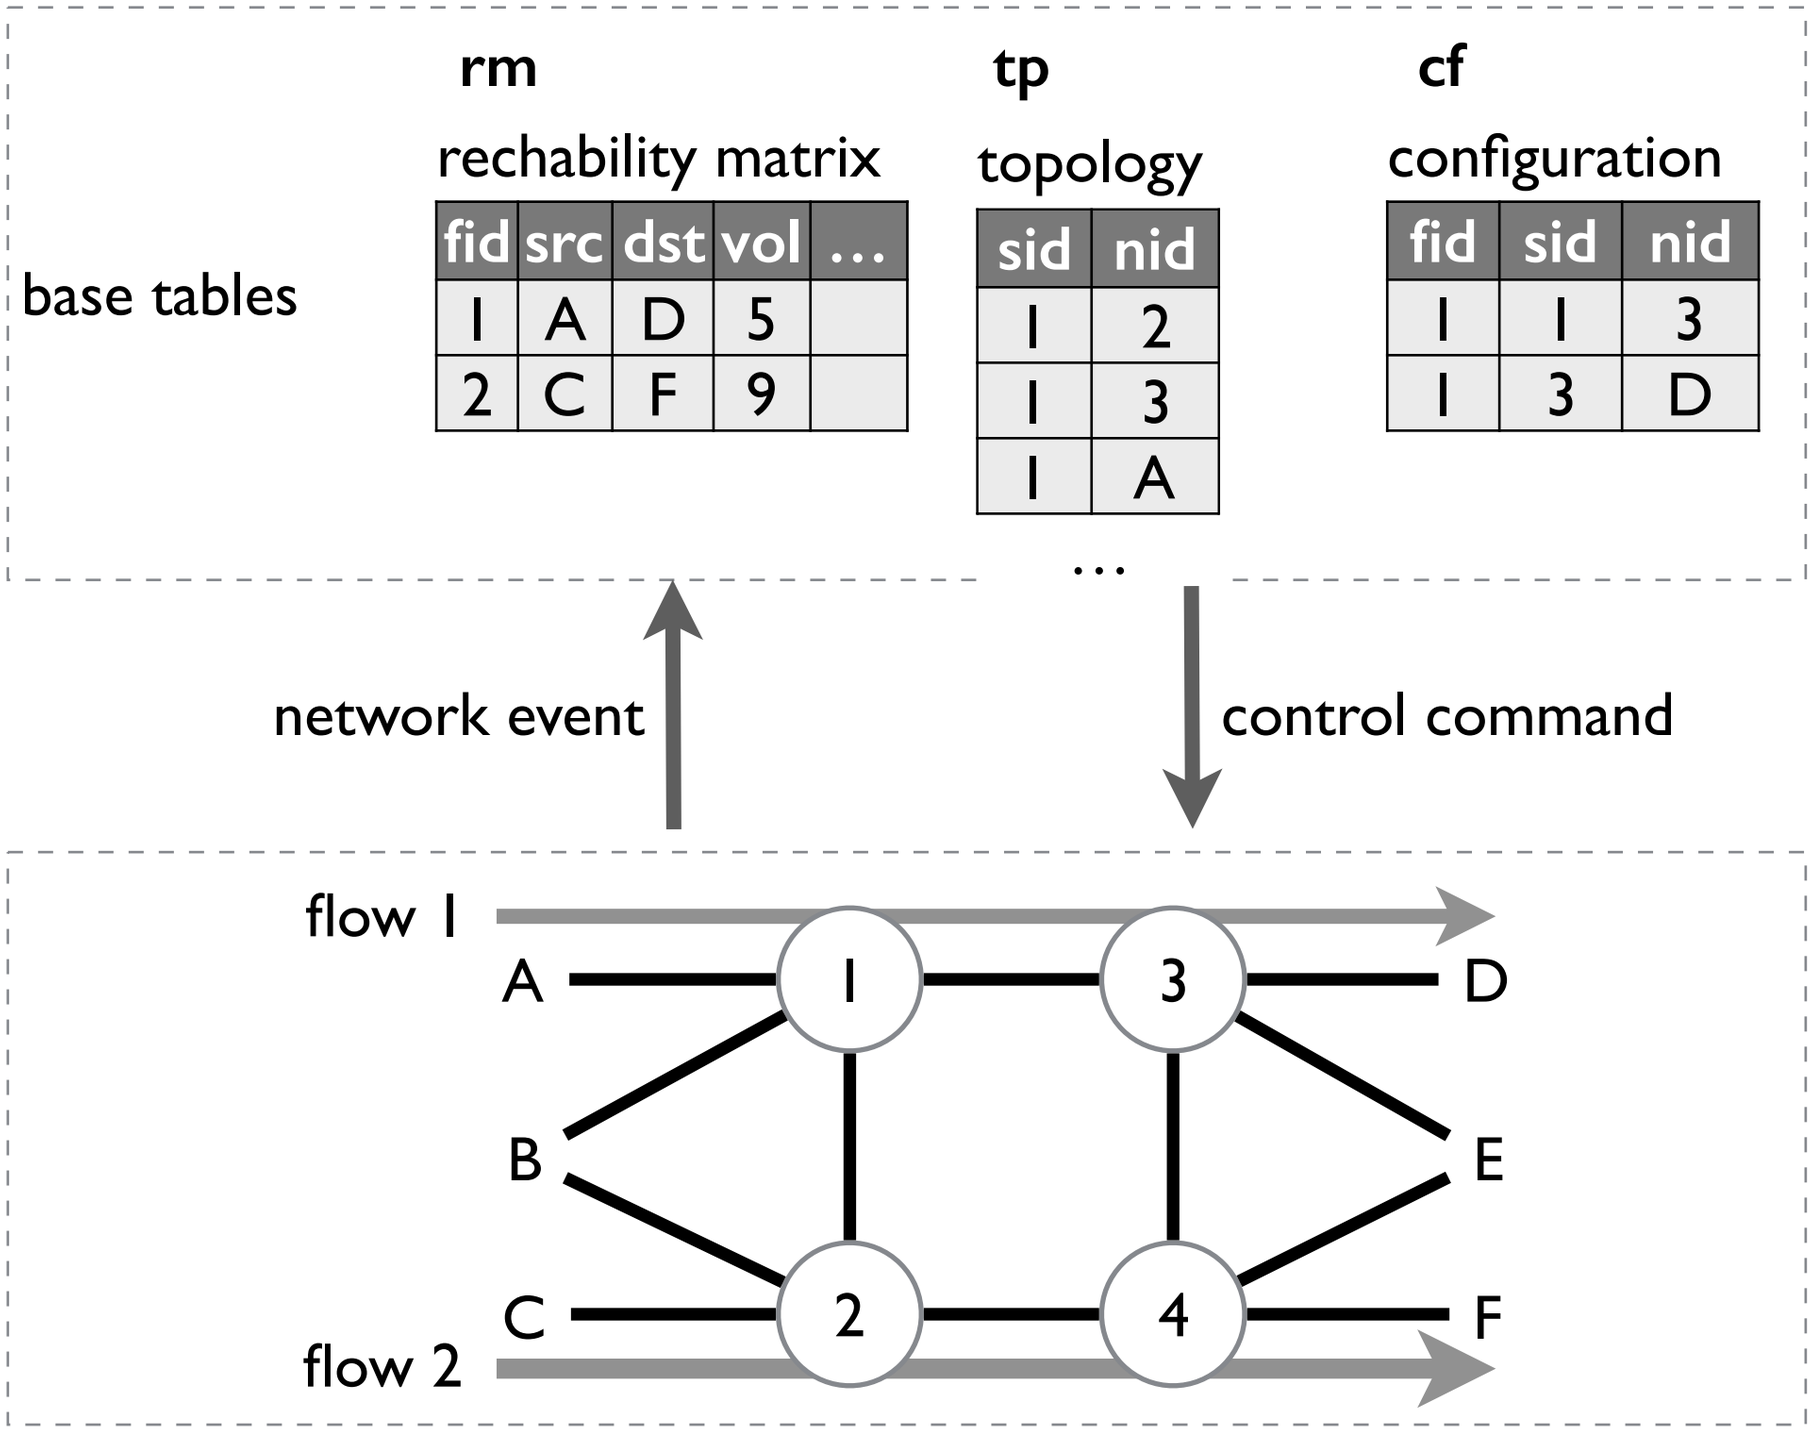
Ravel: a realization with SQL database



attractive features

- ad-hoc programmable abstraction via views
- orchestration across abstractions via view mechanism
- orchestration across applications via data mediation
- network control via SQL

abstraction: network tables



abstraction: application view

firewall-specific table

```
CREATE TABLE acl (
  end1 integer, end2 integer, allow integer
);
CREATE TABLE server (uid integer);
```

abstraction: application view

firewall-specific table

```
CREATE TABLE acl (
  end1 integer, end2 integer, allow integer
);
CREATE TABLE server (uid integer);
```

control loop: monitoring firewall view and repairing violation

```
CREATE VIEW acl_violation AS (
    SELECT fid
    FROM tm
    WHERE FW = 1   AND
       (src, dst) NOT IN
       (SELECT end1, end2 FROM acl)
);
```

```
CREATE RULE acl_repair AS
    ON DELETE TO acl_violation
    DO INSTEAD
          DELETE FROM tm WHERE fid = OLD.fid;
```

abstraction: application view

firewall-specific table

```
CREATE TABLE acl (
  end1 integer, end2 integer, allow integer
);
CREATE TABLE server (uid integer);
```

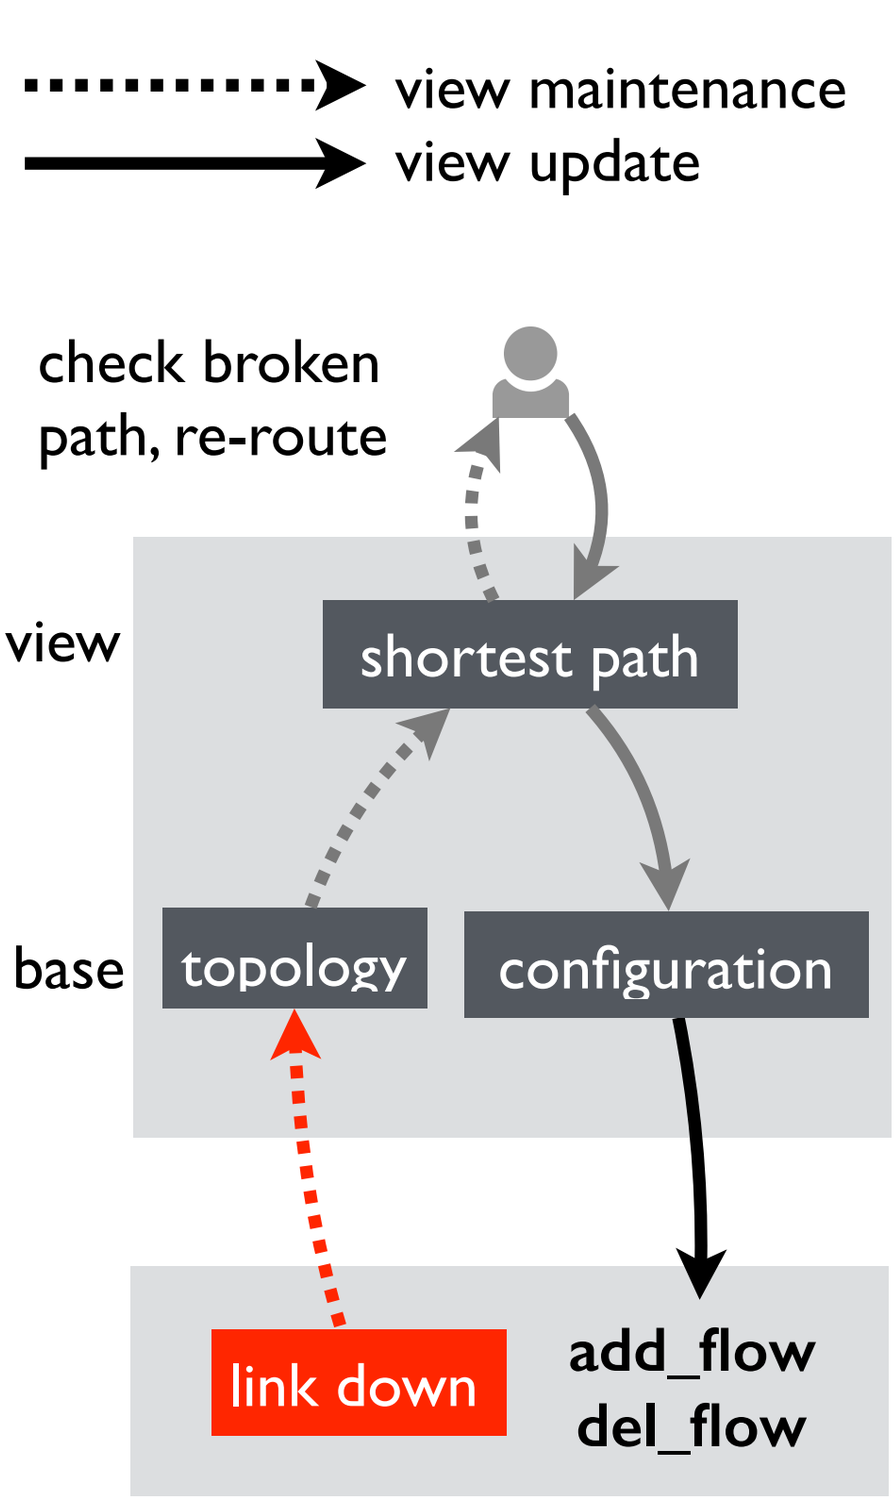
control loop: monitoring firewall view and repairing violation

```
CREATE VIEW acl_violation AS (
    SELECT fid
    FROM tm
    WHERE FW = 1   AND
       (src, dst) NOT IN
       (SELECT end1, end2 FROM acl)
);
```

```
CREATE RULE acl_repair AS
   ON DELETE TO acl_violation
   DO INSTEAD
         DELETE FROM tm WHERE fid = OLD.fid;
```

many more: routing, stateful firewall, service chain policy between subdomains …

orchestration across representations



shortest path rule:
upon broken path, re-route

	shortest path	
	…	path
-		{…,172,39,156,…}
+		{…,172,38,148,…}

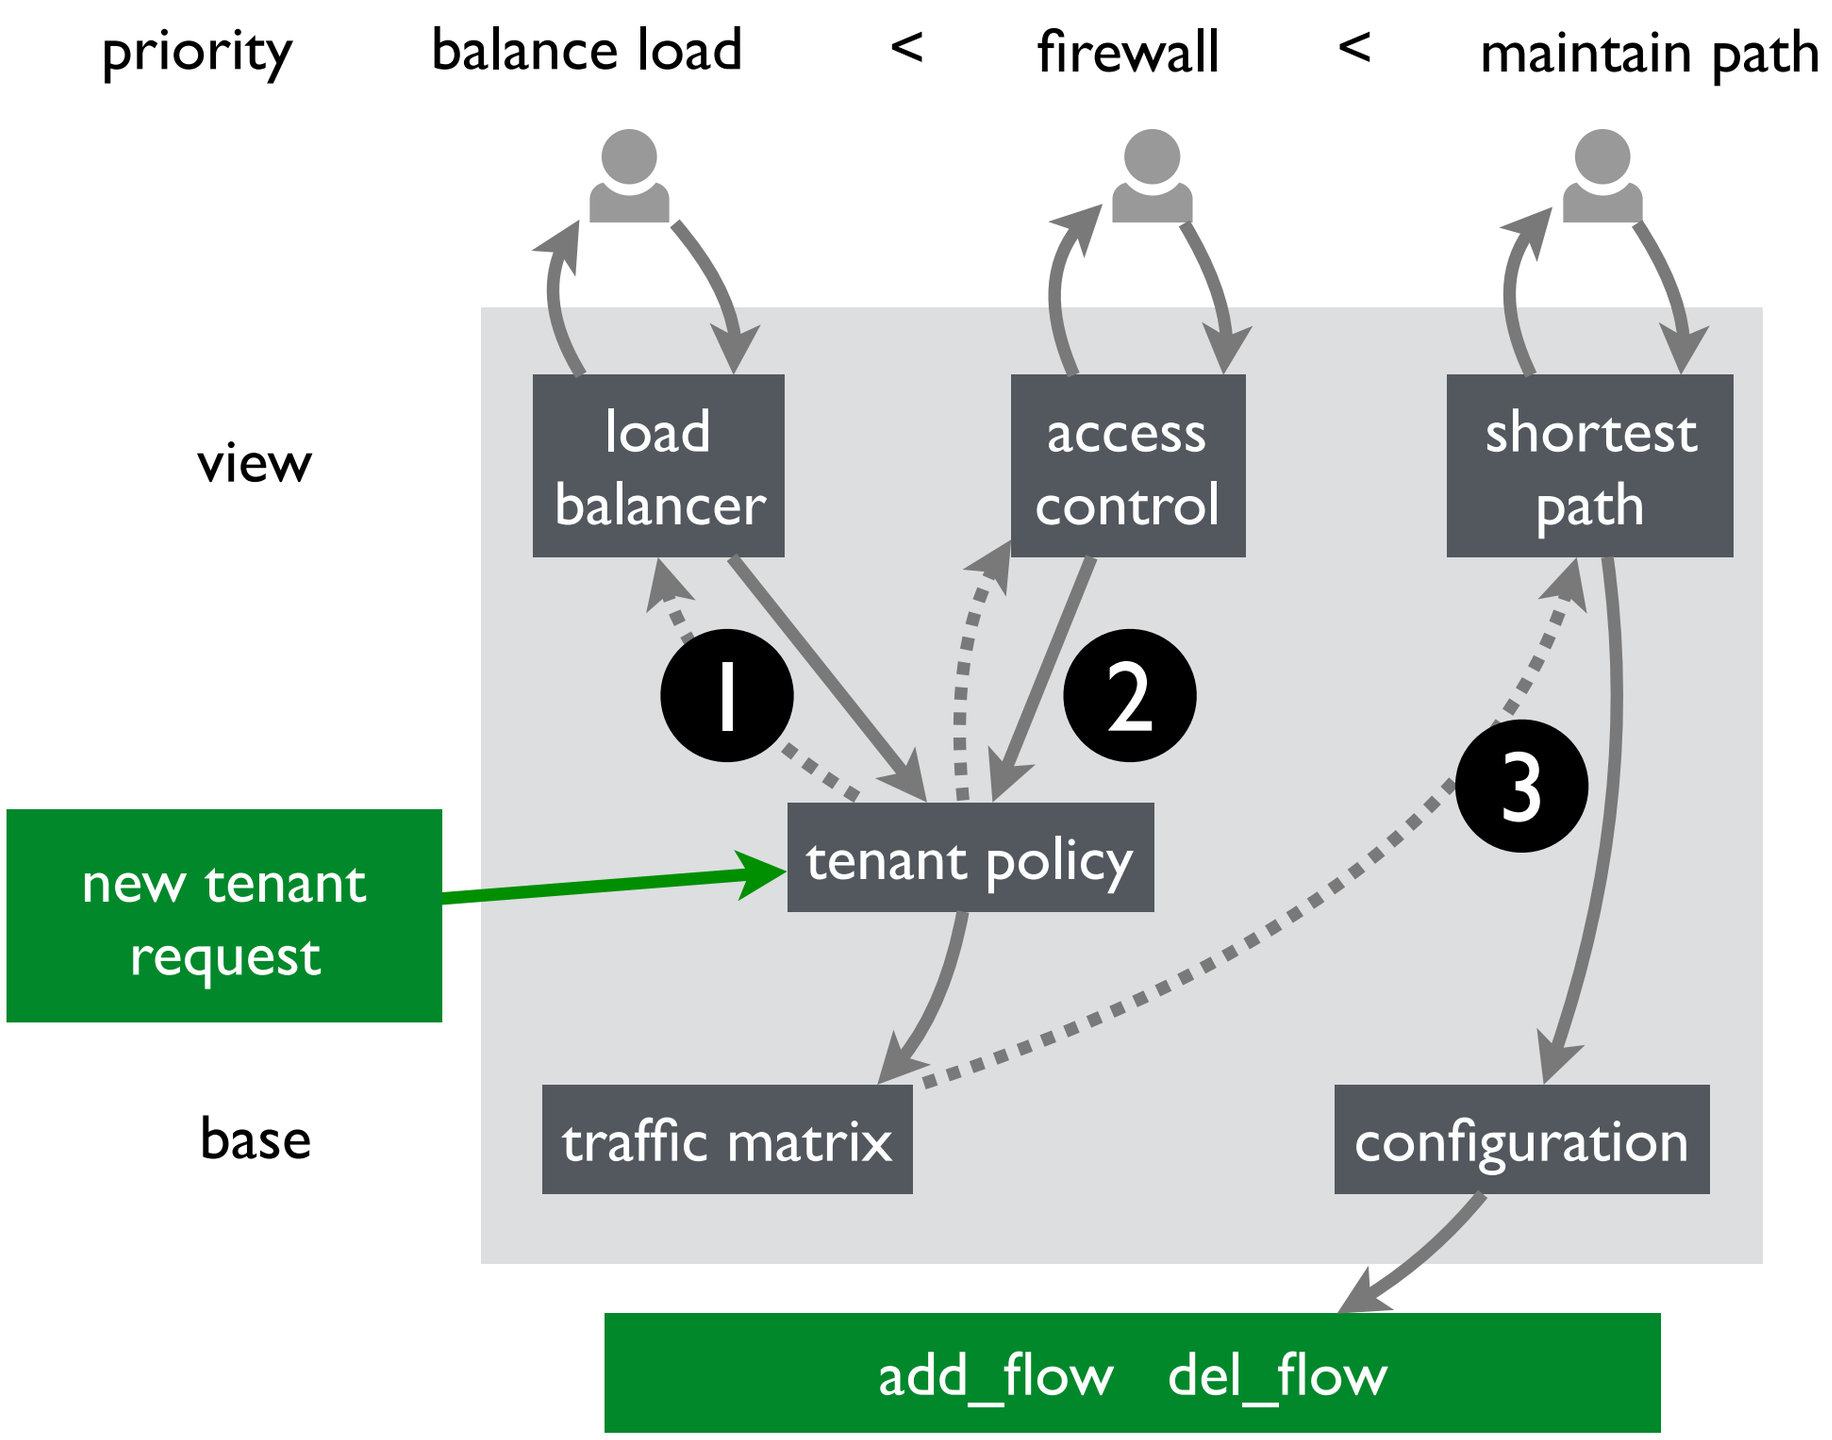
	topology		
	sid	nid	active
-	172	39	1
+	172	39	0

	configuration		
	fid	sid	nid
-	…	172	39
-	…	39	156
+	…	172	38
+	…	38	148

Mininet link (172,39) down

orchestrated updates: re route via (172, 38)

orchestration across applications



orchestration across applications

rebalance route: move 1 unit from 1003 to 1034

	load balancer	
	sid	load
-	1003	4
+	1003	3
-	1034	1
+	1034	2

	access control		
	src	dst	allow
+	1238	1034	1

	shortest path			
	…	src	dst	path
+	…	1238	1034	{1238,…,1034}

+(1238,1034)

1 +(1003,4)

2

+(1238,1034,1)

3

+(…,1238,…)
…
+(…,…, 1034)

	tenant policy		
	…	host	server
+	…	1238	1003
+		1238	1034

+(…,1238,1003)

tenant requests host 1238 to server 1003

+(…,1238,1034)

+(…,1238,1034, path=?)

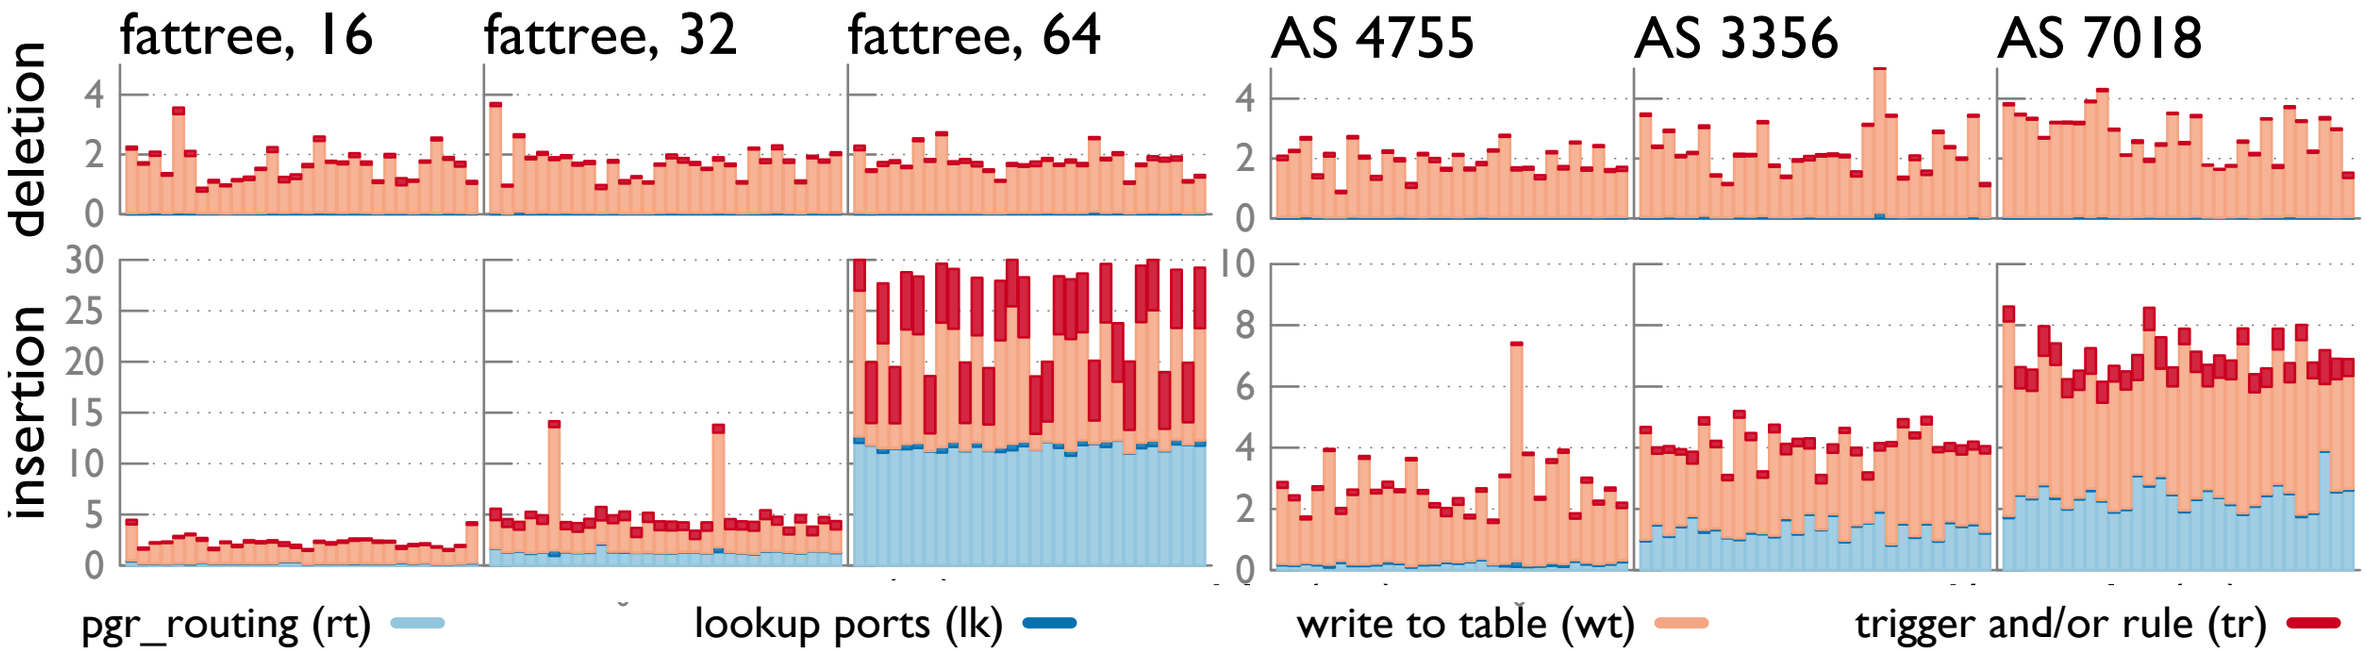
	traffic matrix		
	fid	sid	nid
+	…	1238	1034

	configuration		
	fid	sid	nid
+	…	…	1034

orchestrated updates: install alternative route that is load-balanced and safe

evaluation

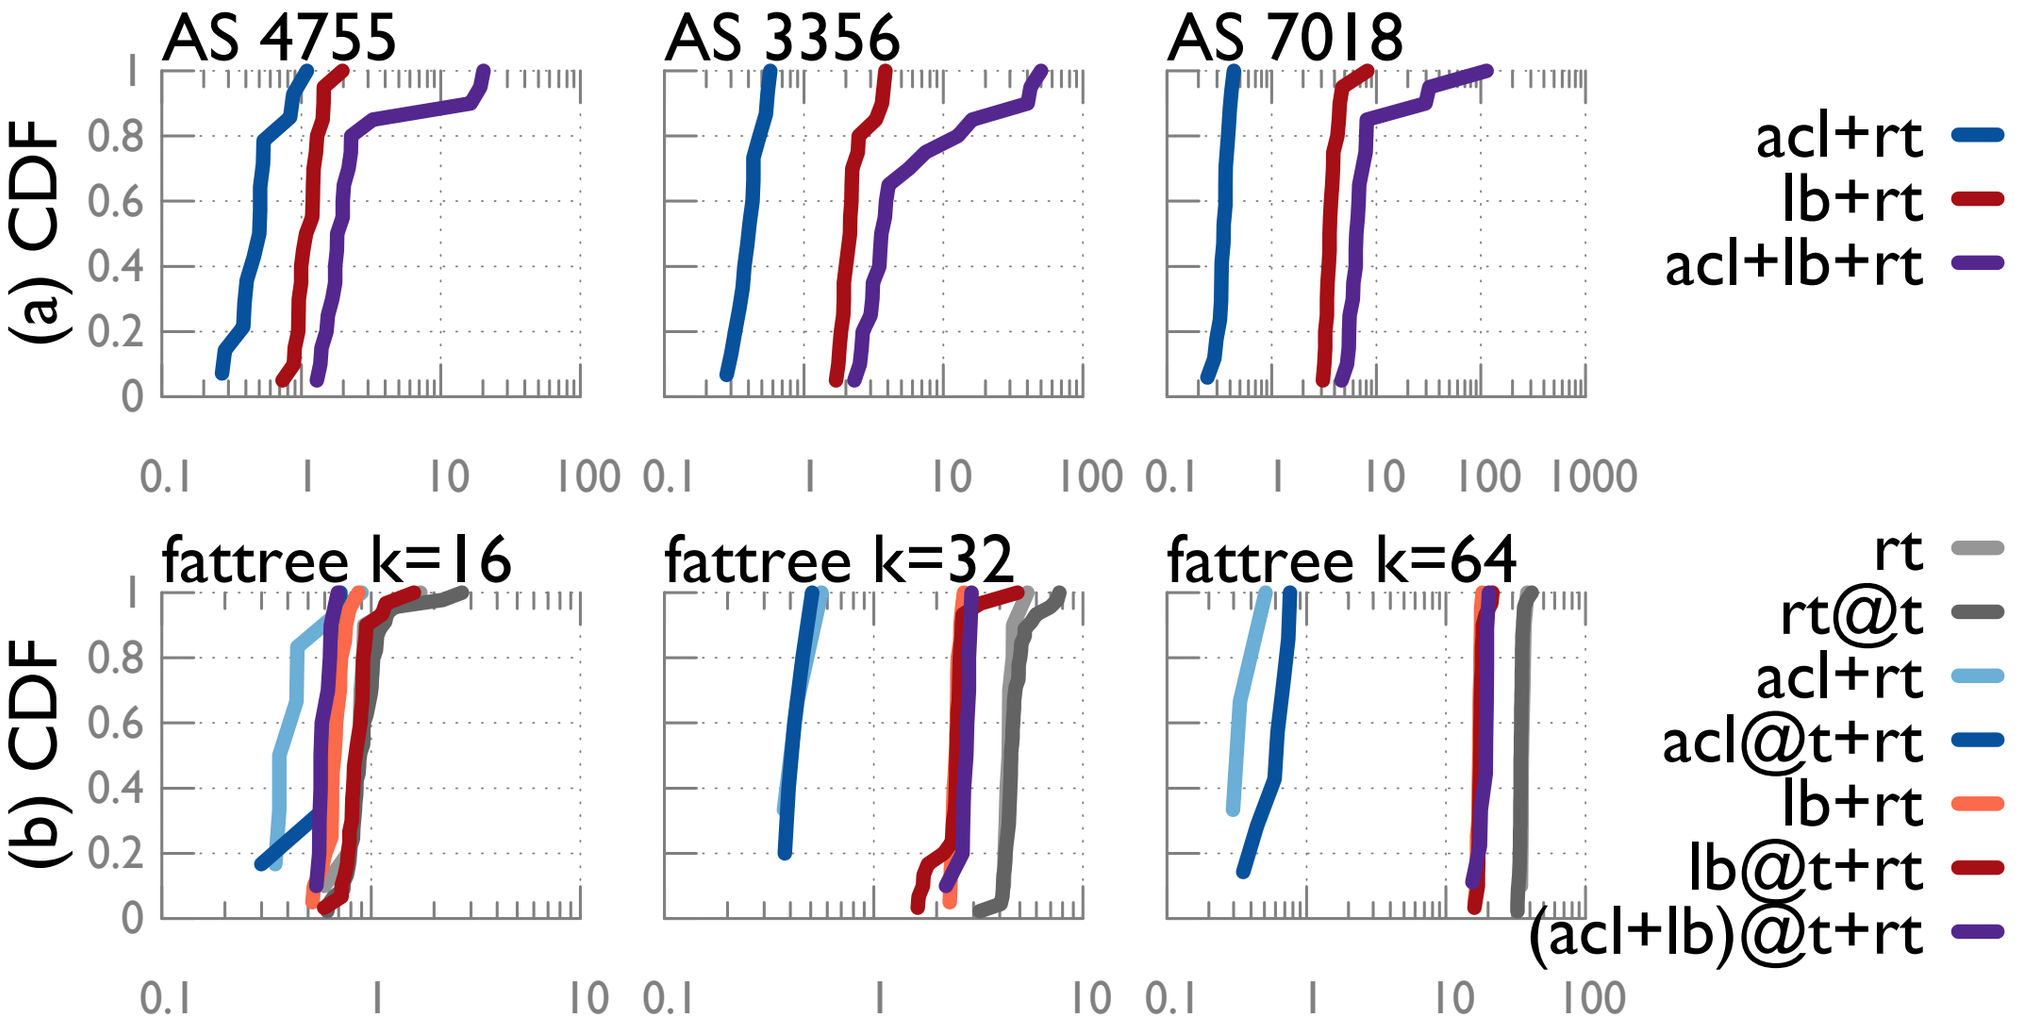
profiling database delay — route insertion/deletion



fat-tree			ISP		
k	switches	links	AS#	nodes	links
16	320	3072	4755	142	258
32	1280	24576	3356	1772	13640
64	5120	196608	7018	25382	11292
			2914	5939	16520

evaluation

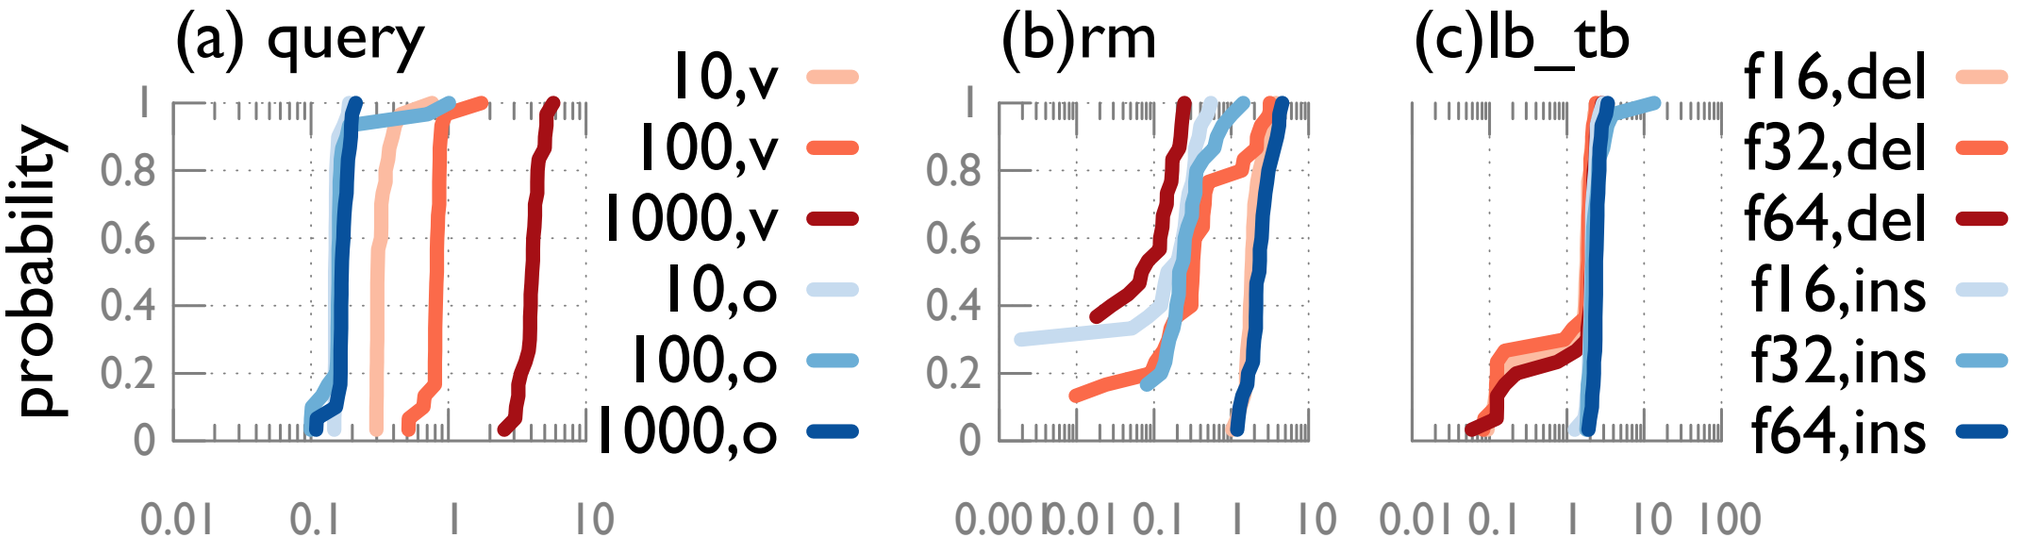
orchestrating access control(acl), load balancer(lb), and routing(rt): normalized per-rule delay (ms)



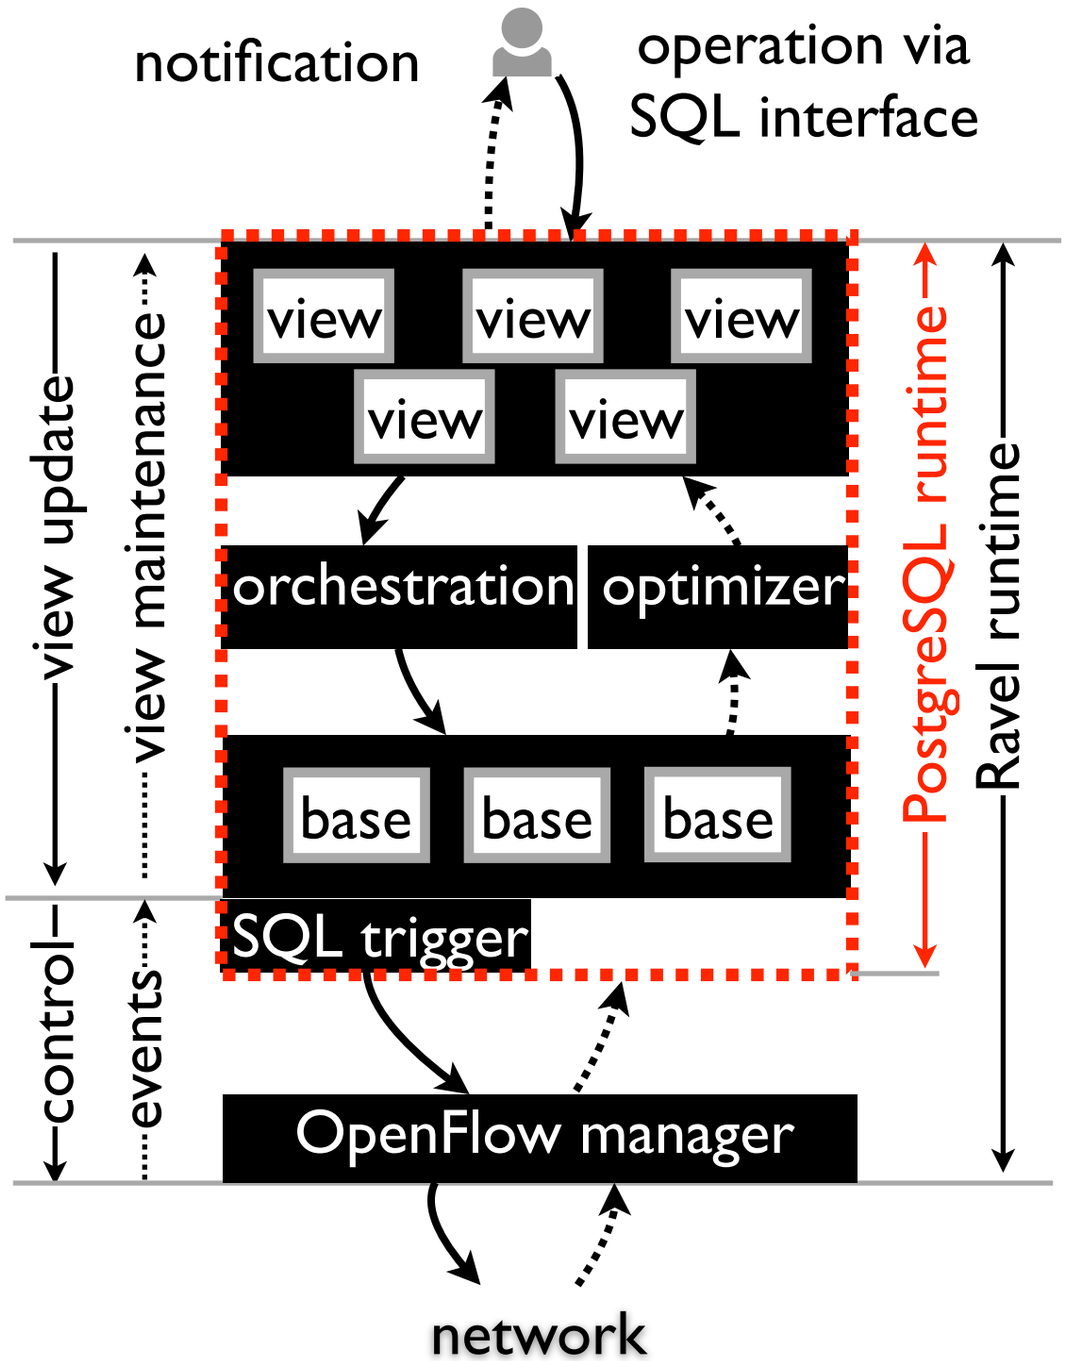
evaluation

optimizing application—materializing views

- faster access to materialized view (a)
- small maintenance delay (b,c)



conclusion



attractive features

- ad-hoc programmable abstraction via views
- orchestration across abstractions via view mechanism
- orchestration across applications via data mediation
- network control via SQL

promising performance even on large networks

looking forward

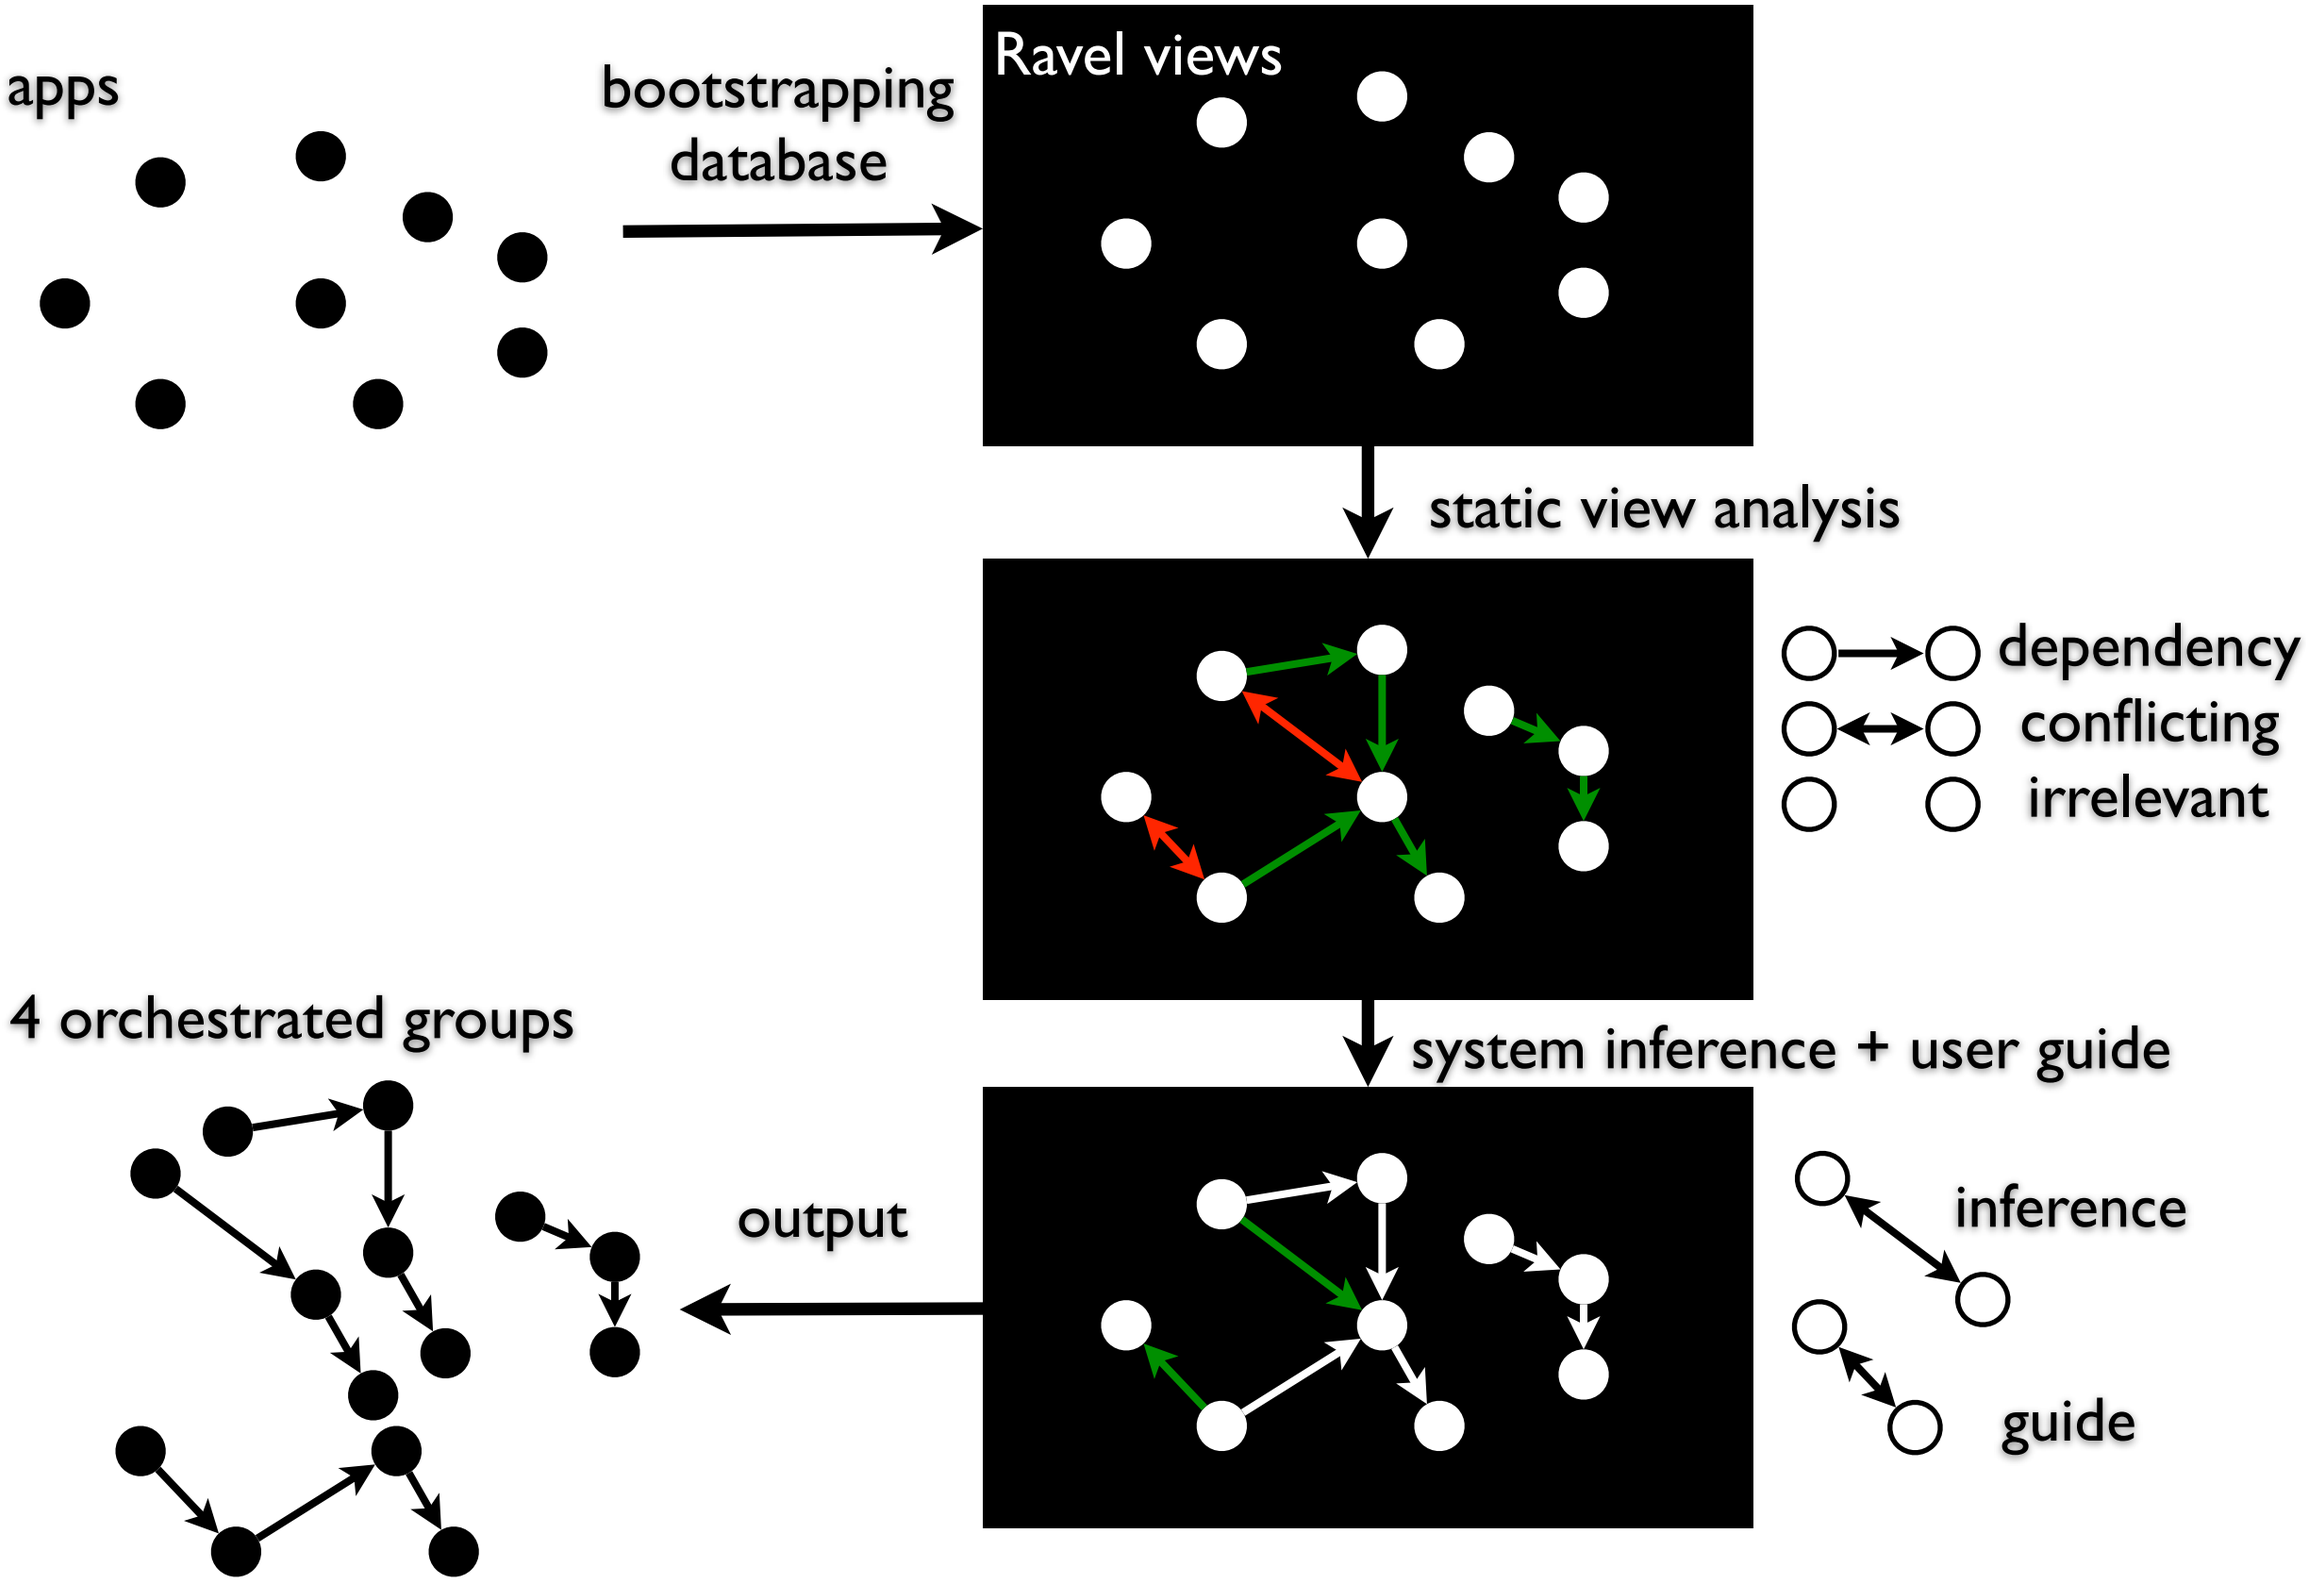
use of standard SQL database enables direct application of many database theories and facilities

- (this talk) flexible abstraction
- network-wide transaction

ongoing work

- synthesizing orchestration

synthesizing orchestration



demo
